A Winning Combination

FUL-O-PEP
GROWING MASH
FUL-O-PEP
CHICK FEED
AND

FUL-O-PEP Adjustable Feeder

Ful-O-Pep Feeder Adjusted for Young Chicks

Ful-O-Pep Feeder Adjusted for Half-Grown Birds

Ful-O-Pep Feeder Adjusted for Full-Grown Birds

The Ful-O-Pep Feeder is adjustable to feed chicks from one day old to maturity. You increase size and capacity of feeder to meet chicks rapidly growing requirements by turning the top threaded section to the left— same as you would screw cap from a bottle. Price Postpaid \$1.25

WHEN applied according to the Ful-O-Pep way, this combination of perfect feeds and feeder will positively raise more chicks—bigger and better chicks—than has ever been your experience. Oatmeal is the base of Ful-O-Pep Chick Feed. Ful-O-Pep Growing Mash contains oatmeal, fish meal, bone meal, some bran, cornmeal and hominy feed. From our experiments and the results obtained by thousands of other poultry men we are convinced that Ful-O-Pep feeds, fed the Ful-O-Pep way, are productive of more pounds in gain on less feed and labor than can be obtained from any other feed or method of feeding. Numerous unsolicited testimonials are coming in daily — testifying to the wonderful feeding value of the complete Ful-O-Pep line. You are strongly urged to give these remarkable feeds and method of feeding them a trial. The results will amaze you.

Place an order in advance with your local dealer. Get ready for the chick. Ask for a copy of our 1921 Poultry Calendar. Then secure the Ful-O-Pep Adjustable Feeder direct from us. Price \$1.25, postpaid.

Barred Rock Show Birds

THIS SPECIAL AD. IS FOR AMBITIOUS PEOPLE ONLY.

NOTHING WILL CREATE MORE GOOD BUSINESS FOR YOU THAN WINNING OUT IN THE SHOW ROOM! This fact should be memorized by every ambitious breeder. Listen to this proof from a beginner:

"Complete, Miss., Nov. 29, 1920.

"Dear Mr. Holterman—My Aristocrats are certainly doing fine. At our Mississippi and Alabama Fairs in strong competition, I won first pen and best pen in show, first and second pullet and champion pullet, first hen and champion hen in show, etc. I sold during this fair alone three hundred dollars (\$300) worth of Stock. —W. S. Burns." (Notice his sales within a few days on the strength of his winnings.)

EXAMPLES: Market chickens may bring as high as \$2 each. Barred Rock show birds (which cost no more to raise) will easily bring \$10, \$25, \$50 or even \$100 each. A dozen of eggs may bring you 85c on market. This same dozen of eggs, coming from noted Barred Rock show birds, may bring you \$3, \$5, \$10 or even \$15. 312 Aristocrat Barred-Rock hens and pullets last year not only produced 3,000 young birds, but in addition \$12,739 in cash money from eggs for hatching—an average income of over \$40 cash for eggs from each female. Can market chickens or market eggs produce such results? Think it out for yourself and then decide.

The greatest profit of all is made by producing chickens which are equally great as Show Birds as Layers and as Market Fowl. Hundreds of dollars clear profit can be added to your income if you breed such birds. It is this ideal combination of Show Birds, Layers and Market Fowl which makes

The "Aristocrat" Barred Rocks the World's Greatest Strain of Poultry.

The Aristocrats are holding the WORLD'S RECORD today as Show Birds, as Layers and as Market Fowl combined. They stand simply in a class all by themselves and acknowledge no equals.

If you are intensely interested in this vital question simply send for my NEW LITERATURE AND GRAND CATALOG (ALL FREE) which contain overwhelming, tang-

ible evidence to prove the above statement to your own entire satisfaction.

Magnificent Aristocrat Barred Rock Show Birds of just this great quality are now ready to step right into the show room and win out for you. Remember that every Aristocrat is guaranteed so absolutely that you run no risk whatever.

SPECIAL

GRAND BREEDING COCKERELS (at comparatively low prices) wonderful, guaranteed male birds, line-bred, vigorous, and with the power to reproduce their own great quality in the young stock, will be of priceless value to you. These fine "Aristocrat" cockerels (dark and light) are so rich, so superb, so outstanding in quality that they will appeal to you at once. From these magnificent breeding cockerels will be produced many of the beautiful prize-winning cockerels and pullets in America's shows next season. Why not use such birds this season to make great show bird and laying improvements in your flock? Such "Aristocrat" cockerels will help to PUT YOU IN THE LEAD AS A BREEDER. Remember, they are Absolutely Guaranteed. Please act at once, before they are all sold.

ARISTOCRAT EGGS from which my customers are producing such glorious showbirds and layers year after year, are still \$15 per 15; \$25 for 30; \$40 for 50; \$75 for 100; \$300 for 500. These are ABSOLUTELY THE BEST BARRED ROCK EGGS that money can buy.

Remember that Holterman is the man who is furnishing to other breeders so many of those powerful winners in the world's foremost shows.

W. D. Holterman, Fancier

Fort Wayne, Indiana, U. S. A.

NOTICE To Our Dealers and Customers Who Have Bought or Intend Buying Reliable Blue Flame Hovers

Don't Be Fooled Into Buying a Metal Vaporizer For Use in a Reliable Oil Heater. It Is of No Value Whatever.

Asbestos Lighting Ring is the proper thing to use for generating, and does not require gasoline or alcohol for lighting. Use common coal oil.

Complete Oil Heater for Reliable Colony Hover. The simplest, easiest to operate, and most economical heater made. Substantially built and has no flimsy complicated parts to get out of order.

In another ad in this paper we have described in a general way the products of "THE OLD RELIABLE." On account of the forty years publicity which has been given our goods, we do not usually go into minute details in our advertisements. It is not our policy to make mention in any way of our competitors, but we deem it advisable at this time, as a duty to the public as well as ourselves, on account of a misleading advertising campaign now being carried on by one of our competitors, to enlighten everyone interested in any way in oil heated hovers for chicks.

With an all metal vaporizer it is absolutely necessary to use gasoline or alcohol in generating, and same is of no value whatever in the use of a Reliable Oil Hover. We use an asbestos lighting ring for generating our heater to avoid the danger of using, and the necessity of keeping on hand gasoline or alcohol. Coal oil, of course, will not ignite unless some sort of wick is used, and were it not for this fact we would not use any wick whatever. The Reliable heater will burn a perfect blue flame and give an abundance of heat after it has been generated without the use of any vaporizer or lighting ring or wick of any kind whatever. We have perfected a simple asbestos lighting ring which lasts for months, and can be replaced at a very nominal cost—In fact you can make a new asbestos lighting ring yourself by cutting a piece of asbestos the size of the old one, and replacing it in the ring—and the dangerous use of gasoline or alcohol is entirely eliminated.

Our competitor says: "Don't buy a wickless oil burner having an asbestos vaporizer. Such burners are a thing of the past. Also that they are old-fashioned and that the demand for same will be eliminated as soon as the public becomes acquainted with his new improvement." THAT IS AN ABSO-

LUTE MISSTATEMENT. His all metal vaporizer has no effect whatever on the Reliable Oil Heater. If you care to generate our heater with gasoline or alcohol it will do absolutely the same work without any lighting ring or vaporizer of any kind as it does with it. Our last word on this subject is **DO NOT BE HOODWINKED BY BUYING A METAL VAPORIZER AT AN EXORBITANT PRICE FOR OUR RELIABLE BURNER, AS THE COST OF PRODUCING SAME IS BARELY FIVE CENTS.** Frankly, you cannot afford to buy a frail, complicated heater that you know nothing about.

The result of our many years of experience in the Incubator and Brooder business, and the years and years of experience, and thousands and thousands of dollars spent in experimenting, by one of the oldest and best known Oil Stove Manufacturers in the United States, is the 1920 Reliable Oil Heater. Our heater is the simplest, easiest to operate and most economical heater made. It is made with the fewest parts—all complicated valves and thermostats have been done entirely away with, as they are of no value on the heater, that is made to stand up and be depended upon under all conditions.

Thousands of Old Reliable Hovers are being sold each month and the same Old Reliable Guarantee stands back of every piece of equipment we put out. If your dealer cannot supply you, drop us a card, and our new complete catalog describing in detail the most complete line of poultry supplies made, will come to you by first mail.

Poorman has spent 20 years producing profitable layers, and knows how. The performances of his stock in the hands of more than 11,000 customers prove this.

RESULTS

Cincinnati, O., Jan. 30, 1918.

JOHN G. POORMAN, Tinley Park, Ill.

Dear Sir: Enclosed please find money order (\$30.00) for a White Rock cockerel from your special mating. Kindly give me some information as to his ancestry, as I intend to breed him to some extra heavy laying hens. These hens were raised from chicks purchased from you in 1915 and 1916. Have trapnested them and some of the records are 280, 242, 216, 201, 200—not from the date of their first egg, but from November 1 to November 1, same as the official laying contests.

Please ship as soon as possible via American Express to Elmwood Place, to be marked, "Will be called for."

J. J. H.

Are you using my Feather Brooders?

If not, you are not securing the best possible results. Invest \$5 in one of my Feather Boards with full instructions for making the brooder. Two weeks' use will prove their superiority. Hundreds of my customers are using them with splendid results. Why not you?

RESULTS

Grosse Ile, Mich., Feb. 5, 1918.

JOHN G. POORMAN, Tinley Park, Ill.

Dear Sir: Enclosed find my check for \$15.00, for which, with my credit of \$10.00, kindly book my order for 50 Class A day-old chicks.

If possible, I would like to receive this shipment by American Express not later than the 15th of April.

This sure has been tough laying weather for the last sixty days, but you may be surprised to learn that the Poorman Orpingtons have been hugging the 50 percent mark for December and January and have outlaid some White Leghorns which I had given to me last year.

With best regards for the season's success, I am, Very truly yours,
N. A. P.

! Book Baby Chick and Egg Orders NOW !

Do not run the risk of placing your order too late. The demand has not been so great in many years, and the only way to insure delivery when wanted is to **ORDER NOW**

Choice Foundation Stock

I am now offering, for immediate delivery, yearling hens, pullets, cocks and cockerels, the offspring of my very best layers, at the same prices that were in force two or three years ago. No better foundation stock to be had anywhere.

My catalog contains descriptions of my plant by representatives of the leading poultry publications, reports of many of my customers, and also my methods of breeding, care and management. It is fully illustrated and very instructive, and will prove to you that my prices are very reasonable.

Start right, by writing for my instructive catalog today. It has helped others, and it will undoubtedly help you.

JOHN G. POORMAN, Box 100, TINLEY PARK, ILL.

FIVE YEARS WINNINGS IN COMPETITION WITH THE WORLD'S BEST PRODUCERS, UNDER MANY DIFFERENT MANagements AND CLIMATIC CONDITIONS

TO THE PUBLIC: We are now offering for sale mated pens, pullets, cockerels and yearling hens with high trap best records. All this stock is of the same blood lines and closely related to our contest winners. Bred more than twenty 300-eggers and better last season. Believe we are offering stock and hatching eggs from the best flock of high average egg producers in America, if not in the world. Address,

HOLLYWOOD FARM, M. E. Atkinson, Mgr., Box A, HOLLYWOOD, WASH.

Michigan's Largest Pedigree Poultry Farm

where **LAKEWOOD'S PEERLESS LAYERS** are bred for

continuous vigor, long laying period, long cycle, late to molt. After many years of trapnesting we have official records of from 200 to 310 eggs in one year. Write for catalogue.

Leghorns Rocks Reds Wyandottes Lakewood Farm, Box A, Holland, Mich.

BUFF MINORCAS

Again they stand supreme at Chicago Coliseum, by winning 1, 2 and 3 Cock; 1, 2 and 3 Hen; 1, 2 and 3 Cockerel; 1, 2 and 3 Pullet; 1 and 2 Old Pen; 1 and 2 Young Pen. Mr. Greenwood, judge of all Minorcas at Chicago Coliseum, December, 1920, show, said: "Schmidt, you have the best Buff Minorcas I have ever seen or handled. They have the size, type, color and right station." If you want modern Buff Minorcas that not only fill the egg basket, but win in the hottest competition, command me while my line is complete.

Great Line of Cockerels for sale at \$5 up. Correctly Mated Pens at \$25, \$35, \$50, \$75 and \$100.

EDW. F. SCHMIDT

1-4-5 Hens.
1-2-3-4 Cockerels.
1-2-5 Pullets.
1st Adult Hen.
1st Young Pen.
Special Best Display.

WHITES. December, 1919. (Did not show 1920.)

1-2 Cocks.	1-2-3-5 Cockerels.	1st Young Pen.
1-2 Hens.	1-3-4 Pullets.	Special Best Display.
	1-2 Adult Pens.	

Summary of My Winnings at great Chicago Coliseum Shows past 26 months:

Exactly 75 of my Orpingtons stood under First Prize Ribbons.

Ninety-seven of my Orpingtons stood under other Ribbons.

A total of 172 of my Orpingtons stood under Ribbons.

I won more than twice as many Firsts as all my competitors combined.

I have never lost Special for Best Display in Buffs, in Whites or in Blacks at this premier Exhibition, my total Specials for Best Display being Seven by margins of 60 to 90 points.

I have never lost a First on Young or Adult Pen at this Show.

And while you are reading this ad I could put down 150 more birds equal in quality to my sensational Chicago Coliseum Winners last month without the use of one of my Chicago birds. Think this over and act—no progress was ever made by merely considering and never acting. No exasperating shipping delays, and your satisfaction is guaranteed in fact. Terms cash. Wire if necessary.

Big Champion-Bred Standard Breeding Males, \$7, \$10 and \$15 each; \$12, \$15 and \$25 for two.

Champion-Bred Standard Breeding Pens (four females and male), \$35 and \$50; (matings of ten females and male in above grades, \$60 and \$100).

Exhibition Stars—Males, \$25, \$35 and \$50. Pens, \$75 and \$100. (Prices on larger numbers in any grade furnished on application.)

I am breeding the style of modern Orpingtons that win in fact at Chicago and New York. They not only possess massiveness with refinement of outline, proper fronts and station, but have the back and tail shape you must have to distance the other fellow. And they are absolutely unexcelled for purity and excellence of color. Even my cheaper Males would improve 80 percent of the Orpingtons of America. There is no substitute for this blood backed by 20 years of continuous, constructive breeding instead of a year or two of guess work. The birds are ready in perfect condition.

**Read this ad
again and buy
while my line
is complete.**

C. S. BYERS (Active Orpington Specialist Twenty Years) **HAZELRIGG, IND.**

INDEX TO GUARANTEED ADVERTISERS

The guarantee of James W. Bell & Co. is back of every advertisement and every advertiser in American Poultry Journal. We will not knowingly accept advertising from a dishonest concern. Advertisements for patent medicines or mining schemes, or any other questionable advertising, are not accepted under any conditions. We will not knowingly introduce a dishonest advertiser into the home of one of our subscribers. We refuse many thousands of dollars' worth of advertising during the year because we are not willing to guarantee these advertisers to our subscribers. When answering advertisements mention American Poultry Journal and refer to this guarantee.

Advance Mating List Now Ready

WE HAVE MATED from four to six pens in each of our varieties, headed by prize-winning males. No birds from these matings will be shown or sold. THEY ARE RESERVED FOR OUR CUSTOMERS who wish to make early settings. We also have mated pens selected especially for heavy egg production. Our varieties are:

S. C. White Leghorns, White Plymouth Rocks and Rhode Island Reds

WILBURTHA POULTRY FARMS

27 River Road, Trenton Junction, N. J.

FIRST PRIZE HEN JAN 1919 BRED AND OWNED BY WILBURTHA POULTRY FARMS TRENTON Jct. N.J.

Here Mr. Mammoth Operator are real *reasons*
the Wishbone is *the* machine you want *NOW!*

It Saves You Money—Saves Room Produces Better Chicks—and we can prove it!

LET'S get down to hard-tacks—January's the month to talk facts about mammoth equipment!

You know—

- that the Wishbone Mammoth Incubator is scientifically right;
- that it absolutely reduces labor to the irreducible minimum;
- that it is splendidly built to last a lifetime;

The Wishbone Mammoth Saves You Room and we can prove it!

You can get more egg-capacity per cubic foot from a Wishbone than from any other mammoth made. The Wishbone is made to fit any height, any space to advantage.

We've perfected a new heater that is guaranteed to evenly heat as many as three or four decks. This means, that by adding Wishbone equipment with the new patented Wishbone heater, you can make a double or triple-deck machine out of your present incubator without increasing your floor space.

The Wishbone needs so little care and attention that three or four deck machines are thoroughly practical.

—that it compares favorably in price with any incubator on the market.

But, do you know that the Wishbone will save room—will enable you to install more equipment in the same space, thus increasing your profits? Do you realize that, most likely, you can double your present capacity without any additional building—by adding Wishbone sections? *Wishbone construction—new Wishbone inventions—make 3 deck and 4 deck machines now possible!*

What's the size of your cellar or building? Write us, giving full details of the present capacity of your incubator, available space, etc.—we'll show you how to increase your capacity.

The Wishbone way assures bigger profits because you put more incubators in the same space at no additional overhead expense. Investigate!

Wishbone Chicks Weigh More

Before you buy any mammoth, find out what kind of chicks it hatches. The Wishbone hatches chicks that are known all over, as chicks that are livable and reliable; chicks that stand shipping; arrive healthy and strong in the dealer's store and give satisfaction to his customers. That's because Wishbone incubation is the right way to hatch chicks—the scientific, tried and proved, practical method. It has been proved in every climate—under all conditions.

We are making one week's delivery

Yes, sir, your Wishbone Mammoth will be shipped to you within one week from the time your order is received. Delivery is a mighty important thing this time of the year and it doesn't pay to take chances. The sooner your order is in, the sooner you'll be prepared to start the season right—the sooner you'll be on a real profit-making basis.

Friendly Warning—Be Careful!

If you buy a machine that infringes on Wishbone patents you render yourself liable to lots of trouble.

Suits are now being brought in the U. S. Courts against infringements of Wishbone patents.

Users, as well as **makers**, of infringing machines are liable to prosecution.

The Wishbone is the only incubator licensed to be made under the famous patents Nos. 1,259,726 and 1,283,402 for selective egg-turning devices and automatic heat regulation of individual compartments in mammoth incubators.

Everything I Say About the Wishbone Can Be Proved

As a pioneer in the incubator business, I have been completely responsible for the development of the modern mammoth. I've been in this business a long time and am in it to continue. You can take my word for any statement I make about the Wishbone Mammoth, or, better still, you can easily prove its truth

for yourself. Somewhere, near you, there is a Wishbone operator. I'll be glad to give you his name. See him—ask him what he thinks of his Wishbone or the responsibility of this company. Or, send for full details about the Wishbone—catalog and price list.

You Can Get Winter Eggs!

*Simply keep the drinking water from freezing
feed Sprouted Oats with the Usual Grain Ration*

One of the best of numerous ways to use the Little Putnam Stove to protect drinking water in cold weather. Not only prevents water from freezing and TAKES THE CHILL OFF, but also keeps litter and filth out of the drinking vessel.

A LITTLE PUTNAM STOVE will keep the water unfrozen at ALL-TIMES. It holds three pints of oil and burns A MONTH with one filling. (Patented principle). Requires absolutely NO ATTENTION, except to be filled; never needs trimming. GREAT TIME SAVER, because its use makes unnecessary the renewal of water two or three times a day on account of freezing in zero weather.

The Little Putnam Stove, holding three pints of oil and requiring filling and trimming but once a month, is used to heat the Oats Sprouter here illustrated. This low-cost Home-made Oats Sprouter is the cheapest to make and easiest to operate—is the simplest and BEST oats sprouter ever constructed. Plans for building it are furnished FREE by me for the asking. It will supply you with better and sweeter sprouted oats with less fuss and dirt and work than is possible with any other oats sprouter on the market, no matter what the price asked.

WATER Over 90% of the Egg is WATER

Therefore, to make eggs and lots of them in WINTER TIME, your fowls must have water to drink and plenty of it. You simply MUST keep UNFROZEN water at all times before them! ONE COLD DAY, with the water frozen and therefore inaccessible, may STOP your egg production FOR A MONTH.

DO NOT REQUIRE your fowls, the should be LAYERS, to heat ice-cold drinking water by CHEMICAL ACTION in the digestion of their food. That is far TOO COSTLY a method and WILL NOT give the desired results. GET EGGS a cheaper, easier, surer way.

The Little Putnam Stove (patented principle), nine inches in diameter, four inches high, holds three pints of oil and burns ONE MONTH without trimming or filling. It is the best thing in the world to keep water from freezing; is used with any kind of drinking vessel—can, crock or fountain.

IN SUCCESSFUL USE FOR YEARS

THIRTY-FIVE DEGREES BELOW ZERO.

West Stewartstown, N. H., March 29, 1920.

Your several Little Putnam Stoves that we have in use are more than a success. In this section we have had extremely cold weather this winter. Many mornings the thermometer has stood from 35 to 45 degrees below zero, but with the use of the Little Putnam Stove not once did I find frozen water in my hen houses. I have them boxed in according to your directions, and that simple plan does the work.

C. H. SMITH.

WE HAD A VERY HARD WINTER.

Willimantic, Conn., May 10, 1920.

The Little Putnam Stove I bought from you last February has, indeed, been all you claimed for it. Although we had a very hard winter I did not have any frozen water from the day I started the Little Putnam Stove. It is truly a time saver, and has proved a real blessing. Enclosed find postal order for plans to build one of your low cost poultry houses for back yard use.

FRANCIS HILL, 421 Prospect Street.

FIFTY PERCENT INCREASE IN EGGS.

Belleville, N. J., October 2, 1920.

Enclosed find stamps for which send me one dozen wicks for your Little Putnam Stove, which I got from you last winter. Wish to say that it is a little wonder! I made an oat sprouter from your directions, heated with this Little Putnam Stove, and have been feeding sprouted oats with about 50 percent increase in eggs, much to my profit.

JOSEPH ZINDRA, JR., 139 Ralph Street.

BOUGHT IT SEVEN YEARS AGO.

Toms River, N. J., March 10, 1920.

Kindly send me plans for the Putnam Home-made Brooder. I am still using the two Little Putnam Stoves I ordered from you about seven years ago while living at Irvington, N. J., and with excellent results. I have been getting eggs right along all winter when others in the neighborhood barely got an egg. Fowls must have plenty of drinking water, no matter how cold the weather, and sprouted oats are the real egg food.

MAX OTTO, Route No. 1.

SPROUTED OATS

To obtain the greatest egg yield you must use some form of LIVE GREEN FOOD that is abundant in Vitamines, so the scientists and investigators HAVE PROVED. Sprouted oats furnish food of this character in a LOW-COST and convenient form.

THE LITTLE PUTNAM STOVE, used for this purpose, gives you the cheapest, easiest-to-operate, and best home-made OAT SPROUTER in the World; and it can be made in a single evening by anyone. No tools are required but saw and hammer. The total cost, exclusive of the Little Putnam Stove, will be less than 50 cents. I shall be glad to send you FREE my easily followed plans for building this Oat Sprouter, also telling you how to use the Little Putnam Stove to keep the drinking water from freezing in COLDEST WINTER WEATHER. Descriptive Circular FREE on request. PRICE OF LITTLE PUTNAM STOVE \$2, direct from manufacturer by PARCEL POST prepaid to any address. Reference, Editor of this Journal. Your dealer should have the LITTLE PUTNAM STOVE in stock. Ask him for it, or I will fill your order, all charges prepaid, at the regular price of \$2 each. Please send me your dealer's name. Address,

I. PUTNAM

The Schwalge Sectional Incubator

The Incubator Unequaled

The above illustration shows our machine at the recent Coliseum Poultry Show, Dec. 1-6, 1920. This machine was set up in two hours and every egg chamber was heated up to 103 degrees within three hours after it was set up. Many visitors looked at the thermometers and were astonished at the accuracy and uniformity of the temperature in all the egg chambers.

Some of the Advantages the Schwalge Sectional Incubator Offers

You can start with a 400 egg "Two in One" section and enlarge to 2,400 egg capacity single deck; 4,800 egg capacity double deck. Or you can start with an 800 egg "Four in One" section and enlarge to 4,800 egg capacity single deck; 9,600 egg capacity double deck.

Every section has two or four egg chambers (two in the 400, four in the 800), of 200 egg capacity each. Each chamber is entirely independent of the other and they can be set at different times. Any chamber when not in use can be turned off thus saving oil.

There are two trays to an egg chamber (each tray holding 100 eggs), which may be adjusted for pedigree hatching, if desired.

The nursery has a separate door, which permits removing the nursery without opening the door of the egg chamber.

It is heated by PURE RADIATION HEAT, combining the advantages of the hot air and hot water machines, and avoiding the undesirable features of both.

Has the most UNIFORM TEMPERATURE within the egg chamber.

OUR MOISTURE GENERATOR is very valuable when operating in dry climates or dry surroundings. As little or as much moisture as required can be added in the most simple, correct and sanitary manner.

VENTILATION is distributed over the entire egg chamber; not just in one spot.

All Our Machines Sold Subject to Absolute Approval or Rejection. Your Decision to Be Supreme; No Arguments. Average Hatches in Our Machine 75% of All Eggs Set

Send for our 1921 catalogue, mailed free on request

Stop Hatching Weak Chicks

With Cheap Incubators

The sort of hatches you may expect with a Queen.

Mrs. Chas. Klenk, Wells, Minn.

Remember it is not how many you **hatch** that counts, but how many you **raise**. Chicks that hatch out **weak and wobbly**, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Strong, Vigorous Chicks That Live and Grow

The Queen is accurately regulated — taking care of a temperature variation of 70 degrees without danger.

It is built of genuine California Redwood — very scarce in these days of imitation and cheap substitution. Redwood **does not absorb the odor** from the hatching eggs. Cheaper woods and pasteboard lining in iron and tin machines, **retain the odors**, to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is **cheap in the long run**. It will be turning out high percentage hatches years after the cheap machines have been junked.

Sold by good dealers all over America. Catalog sent free on request.

QUEEN INCUBATOR COMPANY, Lincoln, Nebraska

Stop Losing Chicks

A Queen costs but little more, and the extra chicks that live and grow soon pay the difference.

Sizes: 60 to 2000 Egg

Owen Farms Flocks

Stand Pre-eminent in

S. C. R. I. REDS

S. C. WHITE LEGHORNS

WHITE PLYMOUTH ROCKS

BUFF ORPINGTONS

Nineteen-Twenty was my banner year from every angle. All over the continent and abroad Owen Farms birds in Customers' hands won the highest honors where competition was the keenest. More Owen Farms birds in the trap-nests of customers passed the 250-egg mark than ever before, and several passed the coveted 300 egg mark. The sales of Owen Farms stock and eggs for hatching were the largest that I ever made.

1921 Will Excel the 1920 Records

- Because**—My matings are better than ever before.
- My show plans will be made to suit your convenience.
 - Satisfied customers all over the world are boosting Owen Farms as never before.
 - Your absolute satisfaction is my first thought, and you are insured full value, and a little more, for every dollar you spend with me.
 - Interest in Standardbred poultry is increasing.
 - You will find here choice cocks and cockerels in each of my varieties to head your matings at low prices for their quality, and potential breeding possibilities.
 - You will find here grand hens and pullets in each variety to complete your matings or to be mated with my males to produce the quality chicks you desire.
 - You will find here eggs for hatching that will give you the finest chicks you ever grew.
 - If you will come here and see my flocks you will realize their outstanding quality.
 - If you cannot come, but will write me fully and frankly your exact wants, I will talk with you on paper exactly as I would were you sitting beside me at my desk.

1921 MATINGS

Include the choicest cocks, hens, cockerels and early maturing pullets ever placed together. They will produce the finest average quality and the nearest perfection exhibition specimens ever produced in my varieties. By purchasing eggs here, you will share with me the

chances for producing the finest birds of the year. **Remember**, the birds in my matings include winners at New York, Boston and Syracuse and linebred descendants of the leading winners in my varieties at the greatest shows. My mating list will give you the complete story.

BREEDING BIRDS

800 strong, sturdy, range-grown cockerels that were bred from my finest matings are here to head your matings. Whether you pay \$10, \$15, \$25 or \$35, you will receive exceptional quality for your money. A few choice yearling cocks at \$15 and \$25 each. You can order directly from this advertise-

ment and will select the exact bird or birds to help you, if you will tell me your strong and weak points. Fifty sturdy utility Leghorn cockerels at \$7.50 each for immediate shipment. A few fine hens and pullets to complete trios and pens for quality foundation birds.

"Once An Owen Farms Customer, Always An Owen Farms Customer"

Has become a truism. This large, substantial, permanent business has been built up by giving "Golden Rule" treatment. Satisfied customers have always been the best boosters of Owen Farms. Every effort is put forth

here to help you make a success, and the liberal Owen Farms guarantees make your absolute satisfaction a certainty. Write me fully your requirements and receive my complete mating list and a personal letter.

BETTER PARENTS FOR THE 1921 CHICKS

The Foundation of Success in Profitable Poultry Keeping Lies in the Breeding Pens Which Produce the Hatching Eggs for Chick Production—Selection of Males and Females That Are to Be the Parent Stock.
By Willard C. Thompson

EVERY egg that finds its way into the incubator or into the nest under the mother hen should be expected to send forth from its shell, on the twenty-first day of its incubation, a good sized, liveable chick that will have inherent strength and vitality sufficient to enable its continuous growth and development into a mature fowl. Unless we can produce hatching eggs that will show a large percentage of fertility and hatchability, we must figure on an increased cost for every chick that does hatch and live. Infertility and low hatchability drain our poultry farms of really large amounts of real money each spring.

It matters not how large our poultry plant may be, whether it is a commercial plant, a farm flock, or a city lot venture, we cannot afford to incubate other than the very best of hatching eggs this coming spring of 1921. Perhaps a part of the losses in poor incubation may be due to faulty methods after the eggs were produced, that is, in the handling of the eggs, or in the management of the incubators or broody hens, as the case may be, but in hundreds of cases the real cause of the trouble lies farther back, in the parent stock that produced the eggs.

In our poultry work we must not get very far away from the idea that like produces like, and that unless we use great care in selecting the breeders we have little reason to expect economical hatching and brooding, or improvement of our flock during the season to come. The poultry farmer is standing still who does not see some improvement in the quality of his birds each fall as he gathers in his pullets, and then some improvement in the capacity of his birds to handle food materials and turn them into eggs and meat.

It is January! There is no better time in all the year to consider for a few moments some of the things that we, as poultry raisers, can inaugurate right now to bring about better prospects for 1921. The past year may have been a fairly good one for us, but can we not make this coming season even a better one? If there is any agricultural industry that should be "up and a-coming," it is the poultry.

In poultry keeping we have many fowls that are utterly unfit for the production of hatching eggs, because they are birds the like of which we should not perpetuate in our flocks. It would be far better if the number of fowls used as breeders each spring were cut down materially, greater stress being laid on quality than on number. It is better economy to produce fewer hatching eggs and better ones than a large number of eggs that will either not hatch or produce poor chicks.

Getting Ready for the Breeding Season.

Now, to put this idea in concrete form! During early January let us go out into the poultry house for the purpose of selecting and identifying the fowls that we want to use as breeding stock. In doing this we should be armed with certain information and equipment, for it should be done right, if we are to make the effort count in dollars and cents.

First, let us determine approximately how many hatching eggs our business is going to demand through the spring, and this will be determined by several factors. Are we simply going to hatch for our own use? Or are we going to sell hatching eggs, a side line in which there is good money, provided we have the quality in our goods. How many baby chicks do we want? How many hatches do we expect to bring off?

What is the capacity of our incubators? Anyway, we can figure fairly close the number of hatching eggs we will want.

Past experience will have taught us about what percentage of egg production to expect from the breeders during this spring season. We must have some idea as to how many breeders we actually need, and there is no reason for mating up more fowls than we need.

Now, we should know something of the performances of the hens from which we are to select the females for the breeding pens, and especially know something about the family history of the male bird that will head each pen. More can be done in one season to improve a poultry flock by using males of known ancestry than in any other one way. If

An ideal range for the breeding pen. A 10-foot long, 7-foot deep colony house on the U. S. Department of Agriculture's Poultry Farm.

we have been trapnesting so much the better, for then we have something tangible to work with. If not we will have to be guided by what we remember about individuals and flocks and what a record of pen-production during the previous season has to show.

It is desirable to have a supply of leg bands, perhaps colored celluloid bands, with which to mark the fowls selected for breeding purposes.

The breeding pens into which the selected breeders are to be placed should be prepared. These breeders should be separated from the table-egg producing flocks of pullets or older birds not wanted for breeders.

Selecting the Breeders.

A good breeding hen should have health and vigorous strength. No hen showing the marks of any disease, or any signs of weakness, emaciation, or lack of robust health should be used as a fowl from which hatching eggs are to be produced. A good breeding hen, in January or mid-winter, should have regained good body flesh and some surplus body fat, be in good condition generally, have bright red face parts, and full, bright comb, and prominent eye. These point out abundant blood circulation, which stimulates egg production and puts strength and vitality into the germs.

The healthy hen is the happy hen, evidencing this by cackling frequently, scratching busily, and eating sufficiently. Watch the flocks for a little while and the best hens, as to health at least, will soon be very evident. Of course, this is only one point to be considered, but it is an important one. Do not breed from "have beens," that is, hens that have been sick and are apparently cured. Once in a while the exception is found, but avoid the practice generally.

In making selections of these stock birds, size for the breed and type should be considered. In raising Standard-bred fowls we all know that for practically every common breed there is a weight to which we should breed. Therefore select breeding females that are approximately near this size, other things being equal. An under-sized hen is handicapped, and will produce under-sized chicks. When a hen has developed to her proper size and weight the chances are she has strength and vitality to go with it.

In the matter of type: No matter how much we are enthused with the idea of improving the utilitarian worth of our birds we should not forget, in selecting our breeders, to have due regard for color and type. If we are breeding Plymouth Rocks let us bear that ever in mind and let good Rock shape and type, and color even, weigh quite heavily in our judgment as to what hens should be selected to perpetuate our flocks. We cannot develop a high-class demand for our products unless we do this, along with improvement in egg producing capacity and utility worth.

Lay stress on records of performance. It stands to reason that if we can know exactly what number of eggs the hens have laid during the year of 1920 we can select with more accuracy.

If we do not have these detailed records we can at least consider the body characteristics that indicate business ability. Like produces like, and layers with good capacity will produce good pullets; or, at least, the odds are greatly in favor of them doing so. They will also produce cockerels that will transmit good capacity to their offspring in future breeding seasons.

What are these signs of good potential egg-laying capacity? In brief, they are (a) handling quality, that is, loose velvety

skin, pliable, well spread pubic bones, good distance between lay-bones and end of keel; (b) depth of body and length of keel and body, for this means room and capacity for the development of food organs and egg producing organs; and (c) general appearance that points to productive ability.

Next let us consider the age and maturity of the birds we are to use for breeding purposes. Perhaps there is no more common fault among some poultry raisers than trying to breed from pullets, or immature birds. The writer believes that a hen must have gone through a laying season before she is in fit condition to be selected as a breeder. She not only should be tried out as a producer through her pullet year, but after that year her eggs will be stronger, hatch better, and build up the strength and vigor of the flock. Therefore, let us limit our choice to the yearlings and older hens. By the way, it is a mistake to sell a hen after her second year, if she is a good one.

The Breeding Male.

The breeding male influences every chick produced from eggs laid by the hens in his pen, and therefore is indeed half the flock. It is good sound business to pay a little more and get a male bird concerning which we know something, particularly as to the egg production, type and worth of his mother's line of breeding. Pedigreed cockerels are coming more and more into use. If we have not such on our own place, can we not begin this very spring to improve our flock by buying that kind of male from some reputable poultryman? That would be far better than to use our own unknown bird.

Strict attention should be given to the male side of the breeding pens, and among other things the following points should be remembered:

Select the males to be used with due regard for all the points above mentioned as necessary in the hens, with perhaps less attention to the last, i. e., age, for cockerels are often used, provided they were early hatched and have reached good size and maturity before breeding season.

Do not overwork the male birds, and that means mating a limited number of females to one male. In the lighter, active breeds perhaps as many as fifteen to twenty females can be allowed to one male, though near the lesser num-

ber is advised. In the heavier breeders from ten to fifteen is better.

It is better to have a series of breeding pens in which each male and his females are separated from other birds, but when large numbers of breeders are kept and where pens are limited and labor is scarce or high, this point may be laid aside and flock breeding resorted to.

Watch the males as the spring advances. Some may be found to be selective in their mating, that is, not mate with some hens in the pen; others will be found incapable of fertilizing the eggs, and all such must be removed and substitute males put in.

Protect the males especially from severe winter weather, for frosted combs lessen fertility and hatchability of eggs.

Be sure that the males are getting sufficient grain and mash. Especially in large flock matings the males, or at least some of them, are crowded back and do not get enough food.

After two weeks eggs can safely be saved for hatching purposes. If these eggs are from breeding fowls of such quality as have stood the test mentioned above, they should be of good quality. It cannot too strongly be emphasized that our attention should be focused on the breeding pens in January, for the coming season's luck or success, as you will, depends so much upon them.

Two Types of Home-Made Mash Hoppers for the Breeding Pen.

HEART OF AMERICA POULTRY SHOW

A Big Entry of Rhode Island Reds—Some Wonderful Entries in Barred and Buff Plymouth Rocks and White Wyandottes—Buff Orpingtons Strong—Some Club Meets Fail to Bring Out Big Classes. *By Theo. Hewes*

SINCE the present organization has taken charge of the Heart of America Show, Kansas City, Mo., I have tried to shape my work so as to visit this exhibition for just one day, but our dates have conflicted, or so nearly conflicted that I have found the work in connection with the Coliseum Show so important that it was impossible to get away, until this year; but closing our entries a little earlier than common and getting books in shape, I managed to steal out of Chicago and spend a day at the Heart of America Show and with the Heart of America fanciers. The show was held November 23 to 27, 1920.

The old convention hall at Kansas City is a familiar landmark. I have judged there a number of times, but the shows that I judged were held in the balcony, in connection with the Implement Dealers' Convention, and this was the first time that I had had the pleasure of seeing the show on the ground floor. The poultry was staged on the main floor, with the rabbits and pigeons filling up the corridors. As you step into the main hall, you get the right impression. The show is laid out in attractive style, with displays running around on either side of the main hall and about all of the concession space is taken up with booths, poultry journals, feed dealers and educational exhibits. From a visitor's standpoint the show was certainly attractive. The light was good and everything was clean as a pin, and we heard many complimentary remarks from the visiting public.

The Showing of Rhode Island Reds.

This being the national meet of the Rhode Island Red Club and some big money specials being offered both by the association and the club, naturally this breed exceeded other varieties in number, although there was a good display in all of the important breeds, and we believe in some instances the competition was as close as in the Rhode Island Red alley. The judging was not completed until late in the afternoon of Wednesday, and we had no opportunity of studying all the winners in the Red class, but it seemed that Messrs. Card and Tompkins had been consistent in their awards, and we heard but little complaint from the exhibitors. Of course there is always a difference of opinion in a show where there are so many good birds from which to pick the winners, but a glance at the birds would show conclusively that good ones were winning, and it goes without saying that in a class of this size, some good ones are necessarily left out, after twelve awards are made.

Next to the Reds, the Barred Rocks, White Wyandottes and S. C. White Leghorns led in number of entries and of these classes we think it is only fair to say that the winning specimens were of equal merit with the winners in the Red class. This is especially true in Barred Rock cockerels, W. W. Henderson winning second, third, fourth and fifth, E. A. Webb winning first. It is seldom, indeed, that you find a cockerel of this variety, Thanksgiving week, as good as the first cockerel, shown by Mr. Webb. The bird was finished, up to, or perhaps a little over than standard weight, good bone, good Plymouth Rock type and an even shade of barring in all sections, in fact, a specimen that would be good enough to win a place in any show at any season of the year; and while on this subject of Thanksgiving week, it might be well to mention that we rather question whether we are ever going to get big exhibitions in which all the winners in all classes are fully finished in time for such an early show.

It is well to remember that better than 50 percent of all exhibits are made up of entries from the smaller breeders. What I mean by this is, breeders who raise from seventy-five to one hundred birds a year and are in the business more as a hobby than with any hopes of making an independent living out of it. These breeders depend largely on

hens for incubation and have only a few chicks hatched early so that when it comes to selecting a show string prior to the middle of December or the first of January, they have only a few birds that are in condition to show, and necessarily their entries are small; while the big breeder, the one who devotes his entire time to the business, and has thousands of birds to select from, and uses large incubators and expensive brooder houses for starting off the young chicks early, can select a good string and rather have the advantage over the small breeder in this respect. Yet, this may be said for the small breeders: if we will look over the history of the big shows for a period of ten years, we find that more first prize winners in the different classes in all sections of the United States have been produced by these smaller breeders, the ones showing only a few specimens.

This fact was clearly demonstrated at Kansas City this year, even in the Rhode Island Red class, when Mrs. C. E. Lindstrom of Nebraska won first cockerel in the Rose Comb class, with only one entry in the class; in fact, I believe she had less than a half-dozen entries in the show. It is to these smaller breeders, the ones that can give special attention to a few specimens, to which every show management in the country must cater, in order to make the classes in his show complete in quality as well as full in numbers. With the large entry in both Single and Rose Comb Reds, it would not be fair to the exhibitors to call particular attention or to go into detail in describing any one certain specimen, but it is due this lady to say that in this class, and in competition with the best breeders in America, she was able to land this most coveted of all prizes. It is a notorious fact that every breeder whether big or little, considers first cockerel in the open class and first young pen, the most valuable prizes that can be won at any exhibition, because it shows the breeder's skill in producing extraordinary specimens from his own matings.

The Plymouth Rocks.

In Barred Plymouth Rocks the specimens that appealed to me as being above the average, were the first cockerel of Mr. Webb's and first and second cockerel-bred hen, exhibited by W. W. Henderson, and in singling out these birds, I do not want to cast any reflection on the rest of the winners, as they were exceptionally good, but these birds were ahead of their class, in fact, what a judge would term "outstanding," and specimens that would command the highest prices, not only for breeding specimens, but for exhibition specimens as well.

The White Rock class was not so well represented as we had hoped to see, especially at a club meeting. The winning specimens were good, but quite a few birds in this class lacked finish, and some of the birds winning the minor prizes would within thirty days undoubtedly change positions with the winners.

In Buff Rocks it is seldom that we find a better show anywhere. In cocks, hens and pullets, the winning specimens were equal to the winners at any of our national shows and we very much doubt if there will be a better hen shown anywhere this winter than the first hen, exhibited by C. R. Baker of Kansas. The cockerels were not quite so well matured, but enough of the adult plumage to show the quality, while in pullets, the exhibits of both Mr. Baker and Cory & Cory were of the best. They not only had correct color, but they had correct Plymouth Rock shape, good heads, good length of back and body, and carried themselves equal to the winners in the White Rock class, and it is from just such specimens as these that the breeders of Buff Rocks must look for foundation stock. It is a notorious fact that in many of our exhibitions we find females that are winning on color, alone, and when I find specimens of the kind that were shown by these exhibitors, with good head-points and a bone large enough and strong enough to build the (Continued on page 97)

PRODUCING BEST IN PARTRIDGE COLOR

Bright Surface Color Gives New Enthusiasm to Breeders of Partridges—
Dark Slate Undercolor Told the Knell of Partridge Cochins Years
Ago—A Letter from Geo. W. Mitchell.

By T. F. McGrew

THERE is considerable difference of opinion as to what should be the ideal color for the Partridge varieties. There are three Partridge colored varieties, the Partridge Cochin which is the parent variety, and the Partridge Wyandotte and Partridge Plymouth Rock whose plumage was derived from the Cochin. Wonderful advances have been made in the markings and color of the Partridge Wyandottes and Rocks but I believe that they approach closest to the ideal when their color is of a character like that of the best Partridge Cochins. It can then be accepted as a model.

The chief objection to the present Standard for Partridge color has come from members of the Partridge Wyandotte Club, who have drafted a new Standard description which they are anxious to have adopted by the American Poultry Association. Whatever is done relative to this, should be done after careful consideration of what seems to be best for all. Each group of breeders of this color type should accept a color and a color description that has been and can be bred, as a result of care and selection, by single mating.

What Is Partridge Color?

Some have written that the color of the Partridge male should conform to the bright red of the Brown Leghorn male. The question is: what Brown Leghorn male color shall be accepted as the guide? There were two distinct tones of color carried by the Brown Leghorn males at New York last winter, and I should imagine the same was true all over the country, and will be so this season. I should like to see the breeders of Partridge Rocks and Wyandottes counsel with the Partridge Cochin men who are the older, and who have spent many, many years in studying this color-type, and I believe that out of such a conference would come a lasting benefit. It would afford an opportunity for a study of the policy and the methods of breeding that have been practiced by the most successful, and a Standard description could be determined upon that would result in a truly beautiful plumage being bred on all of these fowls, both male and female, through single matings.

As a first consideration, we would ask: What is Partridge color, what has it been and what shall it be? It may be of value to go back twenty-eight years and look into the Standard that was made at Chicago in 1893 and edited by B. N. Pierce in 1894. I will copy the color description as given in that Standard and the present 1915 issue. Let me say, however, that the modern color description for Partridge Cochins was made by the members of the Cochin Club, I think in 1898. I was not at that time in favor of so dark a color becoming Standard but Sharp Butterfield, a foremost judge of the day, and others were, and they, like those who favored the dark color for Brown Leghorn males, had the majority vote on their side and won.

From then until now the Cochin classes at our shows have dwindled to almost nothing. The Partridge colored Rocks

and Wyandottes by their intrinsic value and the energy of their breeders held a few friends to them, but discouragements were many. Well do I remember a male that was shown at Boston, following the call for dark birds. He was accepted at that time as a model for color, yet he was almost black, in fact, looked black when seen in his coop just before dusk one dark afternoon.

Now that the pendulum has swung the other way, and brighter colored birds are the order of the day, those of us who objected to the much too dark a color-description might well say, "I told you so." Unfortunately the color execution has driven a large number of prominent breeders of Partridge colored fowls entirely out of the fancy. Geo. W. Mitchell is the only one who has stuck to Partridge Cochins, and I am quite pleased that he has lived to see his opinion vindicated; and I am sure that others who thought as he did will be pleased with the prospect of a description that can be followed to success.

The Standard for 1894 described the color of the male as bright red or orange red for hackle and for saddle, with a dark reddish-brown for back. It called for a female of the

same color shades. No mention was made of under color. Then came the Boston meeting and the conclusions arrived at by the members at the Fisher's Island meeting were adopted. The modern description for Dark Brown Leghorn males was adopted at the same meeting and double mating, or the production of Light Brown Leghorns and Dark Brown Leghorns, became a common system in the yards of many breeders.

The present, or 1915 Standard as it is called, describes the color of the Partridge male as: "Hackle and saddle, a solid lustrous, greenish-black edged with rich brilliant red; back, rich brilliant red." The female is described as "mahogany brown penciled with

black." Undercolor in all sections, male and female, "slate."

The Danger of "Too Much Black."

This color description has led to comparatively dark shades of color, and the greater part of all those who had Partridge Cochins have been driven out of the variety; and it has caused a lot of discontent among those who have Partridge Plymouth Rocks and Partridge Wyandottes. These results should be considered as evidence that only those who have bred a variety for a number of years and understand the tendencies in that variety, are competent to make a standard for it. Mere judges and Standard idealists should not have full say in such work.

For the male the colors were formerly bright red or orange, reddish-brown and rich deep black; now they are rich brilliant red, lustrous greenish-black and slate under color. For the female it was red or orange, black, reddish-brown and darker brown. Now reddish-bay, mahogany brown, and black, with slate under color. It will be seen from this that the real trouble with the partridge colored varieties is "too

Partridge Cochins, the parent variety from which the Partridge Wyandottes and Partridge Plymouth Rocks derived their beautiful color and exquisite markings.

much black." This too much black has traveled down into the shanks and toes which are in many specimens dusky colored and much too dark for beauty.

Quite a few of the Partridge Wyandottes and some of the Rocks have black collars about their necks, caused by the black extending to the end of the feather. These neck feathers should be surrounded to the very point of hackle with rich brilliant red. This same trouble of the black collar is found on some Brown Leghorn males.

It is neither my wish nor my right to dictate to those who breed any variety of fowls what they shall select for either shape or color, but I do know that the most beautiful of all Partridge varieties are the Mitchell Cochins, and I do know that both Partridge Plymouth Rocks and Partridge Wyandottes can, all of them, be bred in the same way, and thus become so beautiful that their popularity will go ahead by leaps and bounds. Mitchell's Cochins have been the model for beauty in their line for more than twenty-five years. They have been written of, talked of and they have been proclaimed as the very best that can be in the Partridges. If those who breed the American varieties would pattern after them and breed their varieties by single mating to the same ideals, their troubles would be at an end.

The Experience of Geo. W. Mitchell.

Through the kindness of Mr. Mitchell I have from his pen just what he has done, how and why he has followed those methods which have brought such notable success to him. He also gives a formula that others may follow with equal success. I feel that all of us have been highly favored by having these words direct from Mr. Mitchell himself. This is what he has to say:

"In answer to yours of recent date in reference to Partridge color, let me say that in the breeding of Partridge Cochins during the past forty-seven years, color has been the object, on my part, of more study than any other feature of their handling, i. e., the proper blending of shades of color to produce both surface and undercolor that are most consistent and desirable.

"In my early life my business brought me into a close contact with the ladies' dress goods department of a very large store, and I made a study of the matching of different shades of color, which experience was of very great help to me in the mating of Partridge Cochins when, as a young man of but 24 years of age, I took up their breeding.

"I believe it is true that black or white are not considered colors, yet there are more shades of each than of any of the high colors, and the proper blending of black and white has been the means of any success I may have attained.

"The use of too much black in undercolor, results in a loss of penciling, especially in cushion, fluff and feet of the females, and of the bringing in of too much black in the hackles of both males and females, and especially a greenish-bronze in the males which is very undesirable. From my point of view, much of the white appearing in the tails, hackles, wings and feet of the males is due to a too liberal use of black without its proper blending with a shade of slate. We must not make the mistake of using too much white, or light slate in the undercolor, as from its use we will get the light undercolor running too near the surface, hence the necessary study of the proper blending of the two, especially when starting to build up a strain, for we should begin by establishing a proper shade so to bring about the best average results in after years.

"We must always have in mind that two males that may possess the same shade of undercolor may not produce just what we desire in the chicks they sire, as much depends upon the dams to which the sires are mated. It is a great advantage for one to have a perfect knowledge of his breeding birds for generations back, especially if it is expected to get a large proportion of the young stock with satisfactory undercolor; and if we do not have the satisfactory undercolor, we have not any starting point from which to bring about the beautiful surface colors, for I think the undercolor is the foundation of all. In any event, that has been my experience with the Cochins.

"Years ago when many breeders were so much interested in ery dark undercolor in Barred Plymouth

Rocks, almost black in fact, and made demands for such in the Standard, it was not long before inexperienced breeders and judges as well, insisted that the Partridge and Buff Cochins should each have very deep undercolor; the Partridge to be black to the skin and the Buffs to be almost the same shade of color underneath as on the surface, the buff shade running to the skin.

Opposed to the Undercolor Craze.

"I fought the black to the skin proposition as far as the Partridge was concerned, feeling that its use would result in the defects I have mentioned above, and I think my long years of experience have proved that my contention was right. In fact, so strongly was I convinced that black to the skin was wholly wrong that I withdrew my extensive advertising, as I did not wish to inflict upon a customer such birds as I felt would not produce good results in breeding; and I have since confined our breeding to our own pleasure. The products of our yards and strain, however, have continually been shown, and the results of our work with Partridge Cochins have been observed in the exhibits we have made at both Boston and New York.

"It is very difficult to put into words a description of color, as for instance, should I mention that the correct surface color of a Partridge Cochin female was a combination of black and brown penciling, one expert might immediately say that that could not be for in his opinion the correct colors were two shades of brown; whereas, in mentioning black I would not have in mind an intense shade, but a shade that, if put under the microscope, might be referred to by one expert as a soft shade of black, and by another expert as a peculiar shade of the darker browns.

"When reference is made to the black stripe in hackles, we should refer to this shade as a very distinct shade with a beautiful luster. The red edging of the hackles is difficult to describe as there are hardly any two experts that will agree as to just what a rich red may imply.

Difficulty of Describing Colors in Words.

"I am led, therefore, to mention that I do not believe it possible to put into words a description of color that will be understood alike by all. Neither do I believe it possible for any artist, however good, to put upon canvas shades of color in poultry that will be looked at by all as an ideal. Why? because we do not all have the same conception of shades of color, and therefore the living specimen should be the guide, as from such we are much more likely to agree as to what is the ideal, i. e., the one most pleasing in color of surface. This brings me to add that, while theoretically we should use the same shades of color (undercolor for instance) in both male and female, it has not worked out satisfactorily with any breeders of Partridge Cochins whom I have known in the years that are gone.

"Thus I am forced to think that only the close student, artist, if you please, of the combination of shades of colors, will meet with long continued success. Why? Because it is a well known fact that all great painters on canvas find their ideal colors in the happy combination of shades of colors that bring about the proper blending.

"However, we must have word descriptions, and perhaps to change from referring to the surface color of the Partridge Cochin female as mahogany might be a mistake. At best the word implies a solid color, while in reality the surface is made up of a happy combination of two shades of brown penciling, or as some experts would put it, a soft black and brown penciling; my own preference, however, being shades of brown.

"The same ideas prevail in the red section of the two sexes. We speak of 'rich red' and this color we must arrive at in the same way of reasoning. For instance, if we refer to the Partridge Wyandotte Standard, copy of which you enclosed to me, it will be noted that in the description of the neck of the male, it is referred to as 'bright, cherry red.' I wonder if the makers of this Standard stopped to think that there are about as many shades of red cherries as there are cherries, and that two experts are not at all likely to agree upon just what a 'bright, cherry red' might imply.

"I have not attempted to in any (Continued on page 104)

THE GREAT CHICAGO POULT

Big Entry in All Important Varieties—Good Quality Throughout—Splendid Attendance—Some of the Romancers Start Some Fairy Tales About Faking—Breeder's Are Optimistic—Full Awards of the Show.

By F. L. Platt

NOT only the largest but also the best poultry exhibition ever staged in the Coliseum Building, Chicago, was held December 1 to 6, 1920, by the Great Midwest Poultry Association, of which Theo. Hewes is secretary and show manager. There were about 3,300 birds in competition. This big total was quite equitably divided among all the leading varieties, making full classes in all popular breeds, and the show was not top heavy in any one or two breeds. The quality, not only of the winners but of the classes as a whole, was a distinct step ahead of anything ever before seen in Chicago. Birds in such excellent condition never before stood cooped in a show in the west. It is plain that breeders are growing their birds better and thus bringing out all the good that they are breeding into them.

The public seemed to appreciate the great show, and the attendance, usually a weak point with the Coliseum show, was the largest since the banner year of 1912. These visitors found an attractively cooped exhibition, great variety and excellent quality of poultry, and around the big hall, which is 300 feet long and 170 feet wide, there were concession men displaying incubators, brooders, poultry feeds, and many different kinds of poultry equipment. The public is as much interested in these accessories as in the fowls, and when an interested visitor stepped up to a booth to see the wares that were on display, he was met by a gentlemanly, well informed representative. Fakirs and strong-armed solicitors were barred from the show by the management.

The major part of the credit for the success of the show belongs to that indefatigable worker and experienced show manager, Theo. Hewes. No man in the purebred poultry business has more loyal friends than Big Theodore, but the finest compliments came from his old-time critics. If a man is afraid of his friends because they flatter him, he need not fear his enemies, for they tell the truth.

The cooping of the show was attractive. The judging was the best and the most satisfactory of any Chicago show that we have attended. The few weak spots that came to our attention, we shall mention. But, all in all, it was a very smooth running show, and Secretary Hewes was deserving of all the compliments that were paid him whenever a group of exhibitors got together on the floor of the building. It is too bad that he could not have heard all of the words of praise.

The weather during the week was remarkably mild. Is that not a sign of an open winter? For years the announcement of the Chicago Coliseum dates has been a forecast of the first big blizzard of the winter, and the blizzard that rode in from the west this year was nothing fiercer than a little rain storm.

The Utility Classes.

The big fiasco was the showing of utility birds. The capon class was composed altogether of Black Minorcas, until late in the week when a really fine Black Giant capon came in from New Jersey. It is hard to conceive of a poorer capon than a long-legged Minorca whose breast does not plump out. Such were the winners in the capon class.

The utility classes for layers filled better. There were several Leghorns, and two of the males were disqualified for squirrel tail. The first and second hens had not molted and

were in old feather. Are not the brethren in the agricultural colleges carrying this late molting too far? For the love of Mike, who wants a hen that has not molted by December 1? Such a hen may be all right in a warm coop where she doesn't freeze to death when she begins to shed her plumage; she may get along all right when provided with an abundance of nutritious food; but as a general proposition such a hen represents an extreme type, and extremes are dangerous. It is all right to give the preference to hens in old feather at the fall fairs, but nature never intended that hens should grow their winter plumage some time during December or January.

The first Barred Rock hen in the utility classes was such a hen as is occasionally seen in mongrel flocks. She was small, and her markings were so inferior that she hardly deserved the distinction of being classed as a Barred Plymouth Rock. The judge of this class remarked to us that he had tried to find some way to disqualify her—for he was evidently ashamed of having given such a dunghill a first prize in the Chicago show. There were three ways in which a real poultry judge would have tried to have disqualified this bird, and one of them would have worked. He would have weighed the bird—and we believe that she would have been found to be more than two pounds under weight, in which case she could have been disqualified. He would have looked at her ear lobes—and when we saw her there was enough white in her lobe to have disqualified her. Third, this mongrel hen could have been disqualified as a bird unworthy of recognition as a member of the breed. The Standard lists as the very first General Disqualification, which applies to every recognized breed: "*Specimens unworthy of a score or lacking in breed characteristics*" shall be disqualified.

This hen was entered by the University of Kentucky and she was a disgrace to the State of Kentucky and the institution that is spending its time in the propagation of such so-called Barred Plymouth Rocks.

The true utility in chickens is going to come from the purebred breeder down. You cannot side-swipe the 3,300 real birds in the show and say that the progress of the future will be from a little dunghill Barred Rock hen upward.

Such a spectacle as those squirrel-tailed White Leghorn males, Black Minorca capons, and the old-fashioned dominique hen alienates all the sympathy that we have developed for conscientious utility breeders, and we shall have to wait for our prejudice to cool before we can again see much good in their radical program.

It is not necessary to demoralize the breeds in order to get a pedigree egg record. O. L. Putnam showed two Light Brahma hens that won 1st and 2d in the utility class for Brahmas, and they were good birds, having good Brahma type and color as well as good egg capacity. The 2d hen had a remarkable trapnest record. Putnam is a fancier-breeder and was a winner in the exhibition classes. Such a breeder has a future. The radical utility man should realize that radicalism is never permanent, and what good points it may bring out are sooner or later absorbed by the conservative, steady going element.

Over Conditioning or Faking.

There was a great deal of loose talk about faking at the

THEO. HEWES,
Secretary of the Chicago Coliseum Show.
The Man With a Thousand Friends.

show this year. The talk was started in Kansas City. It seems that one breeder had dyed his Rhode Island Reds for the Heart of America show, and the judge, Harold Tompkins, had not placed any of the birds. Harold was worried about the class before he went to Kansas City. He had heard of some of the things that were going to be done. There he was, with an established business of his own, a good name, a wife and five children dependent on him, yet called upon to pass judgment upon the birds and motives of other breeders. He knew he might make enemies that would last through life. With his face set to the future, he did his duty like a man.

The gossip mongers carried their stories of faking into the Chicago show. To hear them tell it, half the Reds had been washed in permanganate of potash and the color set with the juice of lemons, or vinegar, or acetic acid which is derived from vinegar. (Laundry men use acetic acid to set the bluing in clothes and keep it from streaking or running to the edges.)

Well, it must have been a pretty weak solution, for the 1st S. C. Rhode Island Red cockerel gave the lie to 96 percent of the talk. He was a bird that Delano had shipped to a customer for the Minnesota State Fair. He kept on developing well, and was shown at Chicago by this amateur. He did not win first by chance. It was not a case of lightning striking. Before the awards were placed, this bird had attracted more attention than any other one bird on the class, with the possible exception of the 1st S. C. Red cock, and he won on intrinsic merit. Indeed, he had been shown by so raw a hand that several feathers had been left in the hackle that were grayish white at base. When an unknown breeder from Minnesota comes in and beats all the old hands, on a chicken that had been well bred but had had plenty of time to go completely out of condition, the old hands are pretty clean.

But rumors did not emanate only from the Red alley. The atmosphere in the White Leghorn class reminded us of the old days when Dan Young was cleaning up one competitor after another at the New York show. Some of the fellows said some very bad things about Dan in those days, and the only reason they didn't say anything meaner was because they couldn't think of anything worse to say. They did the

best they could at cooking up stories but even a man's imagination has its limits.

This year at Chicago they told about a White Leghorn cock that had had two new sickle feathers glued into its tail, the old sickles having been cut off near the base and the new ones stuck in. This bird was accordingly disqualified, so the romancers related, and he was in a locked coop. Several fellows went down to locate the bird, having been requested to do so by the show management, but the only cocks that were locked were cocks that had won prizes and every cock that had not won was in an unlocked coop. So this story lost its weight; to be followed, however, by another one.

So the tale went, the judge of White Leghorns found a comb that had been sewed and instead of the stitches being taken out, they were cut off; and in judging, Dan Young had pulled out the threads. This story was spun until there was nearly a spool of thread—and the miraculous part of it was that it seemed that some fellows were gullible enough to believe it. How a fellow can work himself up to the point of believing something that he never saw, and on which there is not one jot or tittle of circumstantial evidence, is inexplicable. Among the sober-minded fellows the situation became so ridiculous that Tom Rigg said: "Let us start another one. How is this: There is a hen over there that was blind in one eye, and she has had a glass eye slipped in." But the next morning he had a better one. Said he: "The worst case of faking in the show was found last night when the birds were being cooped out. They found a hen with porcelain teeth."

Of course, the desire to win requires some conditioning. The black feathers in Barred Rock hens are pulled out, an occasional crooked barred feather or an old feather is removed, and that is considered legitimate fitting. But over conditioning, such as bending down tail feathers, showing cocks in cockerel classes, dyeing, and other extreme measures, are properly termed faking. There were two classes which contained birds of this kind. In Buff Leghorns, one breeder had bent down the tails of his birds. The main tail feathers of his cocks and cockerels had been bent in a semi-circle downward. Herman Rickoff judged this class, and this conscientious breeder, who doesn't try (Continued on page 52)

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

The Gospel of Service

Nineteen hundred years after the angels sang to the shepherds at Bethlehem, "Peace on Earth, Good Will to Men," the world became inflamed in a war more cruel, more destructive, more gigantic than any other since the foundations of the earth were laid.

This war of the nations sprang from an ambition for dominion over the lands and destinies of other men. It was a struggle for supremacy, a fierce conflict for mastery. It was the strife in the daily lives of men magnified to the last degree.

We are getting back now to more peaceful ways of thought and action. Greed is no longer unrestrained—greed for authority and the exercise of power, greed for money which is power. The violence that agitated the minds of men has burned itself out. The blood that was sacrificed, the accumulated wealth and property of generations that were destroyed, the tears that were shed, have atoned for the greed of conquest. And, men upon the earth are turning their faces upward to hear anew the teaching:

"and whosoever shall be chief among you, let him be your servant."

With open ears we hear this message and with open hearts we understand its significance. It is the gospel of service. It is an admonition to give honest value, whether in labor or in goods, as the fundamental requirement of leadership.

Service, the dignity of service, is the spirit of the New Year. Of this there can be no mistaking, for do we not already read it in the faces of men and see it exemplified in their actions?

Just the other day a purebred poultry breeder who had called a conference of his farmer-growers, said to them:

The price that I shall pay you per dozen for the cockerels and pullets that you will grow for me the coming year will not be reduced. But, I shall require that you grow the birds better, that you give them more care and attention. I want still better stock with which to fill my orders.

Perhaps I should say at this time, that I am arranging for the purchase of two new breeding yards of fine quality birds, at a cost of

\$1,000, and these breeding yards will be placed on two different farms. The cockerels that will head your pens next season will be from these two farms. Thus will we improve the quality of all the flocks.

I want to fill orders with the best quality that we can produce. It does not cost any more to grow a \$30 cockerel than it does to grow a \$15 one, and I want \$30 cockerels to ship out on \$15 orders.

This spirit of the purebred breeder, who strives as best he can to produce better and still better birds for his customers, is a practical application of the gospel of service. He is thinking not alone of the income, but also of the out-go. Not alone of his ability to get, but also of his ability to give in return. He aspires to be a worthy servant.

Are not such as he certain to become the chiefs? Are they not sure to know the full measure of success?

The people will be served. The profiteer who would exploit them will have little opportunity to do so in Nineteen Twenty-one. The temper of the people has changed. The disposition of the man who works will be to give an honest day's work for an honest day's pay, and for the dollars he expends he will require honest value and full measure in stock, feed and equipment.

The New Year will be one of service. Our wish is that the happiness and success of those who serve best, may be yours.

Bright Outlook for the New Year

The poultry business is in a particularly favorable condition at this time. It is one industry in which there is no liquidation of stocks.

A retail dealer in dry goods who finds that wholesale prices are tumbling, may sell his stock, not at selling prices based on original costs, but at prices that are low enough to enable him, with ready cash, to replace his goods at the lower current prices.

No such replacement in poultry is possible. The manufacturing season comes only once each year, in the spring, and what the incubators and setting hens then turn out, are the only stocks available or in sight until the annual cycle of the seasons turns around again.

Regardless of the demand that may arise later on, there is no way to increase the supply—no night shift can be put on to increase the output. The hatching season has passed and the chicks are numbered.

The poultry business has not yet fully recuperated from the blow dealt it by the world war; hatching operations have not been heavy enough to bring the stocks up to normal.

During the war the flocks in New England, eastern Pennsylvania and New Jersey were depleted. In Providence, Rhode Island, and environs, the poultry decreased 75 percent, and this was typical of eastern conditions. Feed, which is the raw material necessary to maintain a flock, was not only high in price, but due to sporadic embargoes on shipping, it was impossible at times to get feed. No poultryman can operate with hungry mouths and empty crops. The birds had to be sacrificed.

In the west, numbers were maintained. There is about the same number of hens on the farms throughout the west. But these hens are like a volcano that is inactive part of the time. Their flow of eggs starts in the spring and ends in the summer. The spring surplus is carried over in the great storage warehouses to provide eggs during the winter and thus equalize the supply throughout the year.

But, fresh eggs in the fall and winter are neither a refrigerated product nor are they a farm product. They are a poultry plant product. By far the great majority of these egg producing poultry plants are in the east, where the hen population was decreased during the war and where it has not got back to normal.

We know of no one of these plants that could supply 500 laying pullets except at a prohibitive price.

Because of the shortage of layers, fresh eggs during the fall and winter have been high in price in spite of the fact that feed costs have been coming down. There have not been enough animal machines to convert the feed into eggs. Prices for eggs will remain high until fresh farm eggs from the south begin to come into the market and then there will be the seasonal decline in prices.

There has also been a shortage in backyard flocks. The high price of feed, and, in some sections, the difficulty of getting feed, discouraged back-lotters. They made big strides in stocking up with chicks last spring, yet, at that time, \$6 per 100 lbs. for feed had a repressing influence.

Last spring the late buyers of eggs for hatching and day-old chicks, those who hesitated, found themselves 49 percent in favor of going ahead and 51 percent against stocking up; and after the men of confidence and definite purpose had done their buying in February, March and April, the hesitating late buyers failed to come into the market, and the demand for hatching eggs and baby chicks took a sudden slump, May 1st.

Those who went ahead last spring are now having a most successful year. Feed costs have materially declined and selling prices for fresh eggs have been at high levels.

Lower prices for feed will bring the poultry business back to normal, and the present hatching season will undoubtedly be the heaviest in many years. Cheaper feed means that a poultryman will not have to invest so much money in his birds in order to grow and develop them to a productive age and this, more than any other one thing, will stimulate stocking up.

A contributing factor will be that general business conditions are such that many back-lotters will recall with some vividness the profit and pleasure that they derived from their back-yard flock in pre-war days, and they will again seek this interesting hobby in exchange for costly attractions that are the lure of towns and cities.

There is but one source of supply for those who will buy, and that source is the breeding establishments. A purebred poultry breeder who makes haste to sell stock at this time overlooks the possibilities of a big spring trade.

The poultry shows reflect the interest that is being taken in poultry. Many of the shows report large entries. In other places, where the show is a local affair made up largely of small exhibits from town fanciers, the entries have been light, due to many of the men working part time. But, even under such conditions, those who have shown, have surprised

themselves with the substantial sales they have made and the orders they have booked.

Business is good in poultry, and the season of Nineteen Twenty-one promises to be a big one. Fortunately, breeders have larger and better stocks to meet the demands that will be made upon them than was the case even one year ago.

The Plumage

Plumage has a very practical value. It keeps the body of our fowls warm and dry.

One of the early problems of incubator manufacturers was to build a box that would keep out cold as effectively as does the plumage of a hen setting on eggs. They built double walls of wood and padded them in between.

Many a man who builds a poultry house, yields to the temptation to build it tight that his hens may be warm in winter. A certain measure of protection is desirable and necessary but the fact should not be overlooked that hens breathe all the way through their lungs and have a higher temperature than animals, and that nature has given them an overcoat of her best make.

These light feathers that a hen carries on her body are an effective insulator of body temperature. Moreover, they are a wonderful woven fabric of beautiful color and design.

Let us examine a feather from the back of a hen. The feather proper may be divided into three parts: the quill or shaft; the web or smooth part which forms the surface of the plumage; and the fluff or downy part at the base.

The shaft or quill is the axis from which the rest of the feather extends. The lower portion of the quill is fastened in the skin. It is like the root of a hair, serving as an anchor, holding the feather in its place. But the feather itself is unlike a hair which is constantly growing, for once the feather is grown, the pulp in the quill and shaft becomes pith, and no further nourishment is extended by the body.

If you cut the quill with your pen knife, you find a series of hollow, oblong cells fitting into one another. These cells are now shriveled, but during growth they contained the nutrient matter from which the feather was built up.

The web presents the appearance of a smooth surface, grooved with a number of fine parallel lines. If we place this web under a lens that raises its size twenty times, we behold a woven fabric! We find that the grooved appearances are caused by interspaces between the ribs or barbs which extend out from the shaft.

Again we look at the feather under the microscope and we see these interspaces are filled with the intercrossing of fine hair-like barbules. We study longer and find the barbules are all hooked together.

Split the web; it doesn't give apart readily at first, but a little pressure and the hooklets give; gently stroke it back into place and the hooklets on the barbules go into place and hold the barbs together.

About all we can see unaided by the microscope are the barbs; the rest of the links are finer than the sense of either sight or touch. In fact, the network is fitted together so closely and so perfectly that air cannot force its way through the feather.

The wonder of nature does not stop here. She deposits color pigment in these numberless parts of the feather with a definite regularity and precision that beggars description. We see the barring of white and dark, sharply defined, or a white feather with a black band around its outer border, or a red feather marked with three distinct, concentric lines of black, one band within another.

One of the features of masculinity is the character of plumage common to the male sex. The male has the greater wealth of plumage. He carries long, pointed feathers on his neck and back, and they have a firm web only in the middle portion; the outer half of the barbs, not being hooked together, present a frayed appearance. This is called the top plumage and since it covers so large an area and is so showy in the male, it is of capital importance.

The neck is the only section of the female which has plumage of similar structure, and in this section the female feather is rounder and the web is relatively broader than

Fig. 2. Black Orpingtons as Bred by the Great English Breeder, Joseph Partington, in 1902.

in the neck plumage of the male.

In picking a female to produce the desired top color of neck and back in her male offspring, look carefully to the neck color that the females possess. A strong colored Rhode Island Red cockerel cannot be expected from a dam whose hackle runs light in color.

On the other hand, the breast of the male is the one principal section in which the structure of the feathers is the same as that found in the body plumage of the females. It has become common practice in at least one color,

Feather From Back of a Hen.

the buff varieties, to count on the breast of the male to produce the desired color in pullets. The breast of the male is also a major consideration in mating to produce well barred, laced and penciled feathers in females.

Thus the structure of the feathers indicates that the breast of the male, and the neck of the female, are determining factors in breeding; the male's breast for body color in pullets; the female's head and neck for top color in cockerels.

The plumage of some males, particularly the flat of the back and wing bows of Rhode Island Red males, may be found to be so frayed on the outer edges that the feathers curl. Such birds have breast plumage that is not hard-surfaced and perfectly webbed to the outer edge. The females of such a line will have back plumage that likewise is frizzled or frayed.

Firm webbing to the feather, or hard feather, is also much desired by breeders of the white varieties, for it is the only type that will wash and web out to good advantage. Some buff breeders have lately been washing their females and it is amusing to see the hens that never did possess the proper char-

acter of feather at end of back and over base of tail, come into the show room the worse for having been soaped and drenched.

This matter of texture of feather is as important as the texture of any woven fabric. If you go into a store to buy a rug or a shirt you are not only observant of the size, the shape, the pattern and the colors in that pattern, but also of the weave and the texture. Observant poultrymen and judges likewise take notice of the quality of feather. It is getting harder year by year for the rough plumaged bird to win at such shows as Chicago, New York and Boston.

A CONSTRUCTIVE POLICY.

We are pleased to acknowledge and thus print promptly and with prominence the following communication from Thomas F. Rigg:

I am a candidate for the office of President of the American Poultry Association. I believe that the Association should be given a business administration; that the old organization should be redeemed for the breed-

ers of purebred fowls; that the Standards for these fowls should be given wider distribution; and that the Association should live up to its opportunities in promoting the more general and extensive breeding of our Standard fowls.

Having the leisure and opportunity, I shall be glad to give to the affairs of the Association a great deal of time; and if elected I shall take the initiative to restore the prestige of the American Poultry Association that it may truly represent our great poultry industry.

I stand on this platform.

Mr. Rigg does not ask for support on the basis of personality or friendship. He outlines a policy of progressive action, and then sums up by saying, "I stand on this platform." We like that.

Mr. Rigg is a fancier at heart. He believes that the American Poultry Association should be a great purebred breeders' organization. We believe the breeders of America would like to see that come to pass.

The American Poultry Association is in such condition that the man who is elected to the presidency should be a man who can bring much to the association and be satisfied with little in return. Mr. Rigg is of that caliber.

Black Orpingtons to Now Go Forward.

It was something of a revelation when the news reached American poultrymen last summer that a pen of six Black Orpingtons at the Geelong, Victoria, Australia, egg laying competition had laid 1,733 eggs during the contest year, an average of 289 eggs per bird. The best one of the six layers produced the phenomenal total of 339 eggs during the year.

These records have been commented on by Australian, American and English poultry papers as "world's records," and the astonishing part, to American and English breeders, is the fact that the breed is the Black Orpington.

The well known English judge, Harry Inman, writing to a breeder in Australia, said: "I am glad to hear that the Black Orpington in your country has made such a wonderful advance as

Lady Dunbar, Black Orpington Hen with Egg Record of 472 Eggs in Two Years. Owned by R. G. Christie & Son, Australia.

Allerton Belle, Black Orpington Hen That Laid 312 Eggs in One Year. Owned by P. C. McDonnell, Australia.

REGALS GO WEST

To the Heart of America Show

Kansas City, Mo., November 23-28

At the National Wyandotte Club Meet, Martin's Regals again assert their supremacy by the most stupendous victory on record.

43 Prizes on 43 Entries—67 Birds Under Ribbons

At the Quality Show of the West they won as follows—(W. Burton, Arlington, Texas, judge.)

Cocks—1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th.

Hens—1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th.

Cockerels—1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th,
9th, 10th, 11th, 12th.

Pullets—1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th,
9th.

Pens (old)—1st, 2d, 3d.

Pens (young)—1st, 2d, 3d.

SPECIAL FOR BEST DISPLAY: Two Championship Silver Trophies and the Following Cash Specials:

Best cock, hen, two cockerels, two pullets and pen.

Best four males and four females.

Best eight cockerels or pullets.

Best eight cocks or hens.

Best two young pens. Best two old pens.

Best three cockerels. Best three pullets.

Best three cocks. Best three hens.

Best cock, hen, cockerel and pullet.

Special for exhibitor winning largest number of ribbons. Special for exhibitor placing the largest number of birds under ribbons. Shape and color specials on both male and female. Championship Gold Medal for best cockerel in the American class.

East, West, North, South, the Regals have made wonderful winnings, but this latest victory may well be considered their crowning achievement. These magnificent males and females will be in my breeding pens for 1921.

Regal White Wyandotte Book

New Edition Ready

This new edition just from the press is without a doubt the most complete book ever published dealing wholly with the White Wyandotte. It is full of illustrations from life, and its pages deal with a variety of subjects, including chapters on origin, description, feeding, care of breeding stock, fertility, color characteristics, raising young chicks, washing and fitting for exhibition, poultry diseases, mating and breeding. Wyandotte type described. The frontispiece is a beautiful reproduction of my First Pen at Boston.

If you wish to know more about these famous birds, send one dime for a copy of the Regal White Wyandotte Book. The information it contains will be worth dollars to you.

5000—Cocks, Hens, Cockerels and Pullets for Sale—5000

This season I have the finest flock of White Wyandottes I ever owned. However, the demand is very heavy and orders should be placed as early as possible.

Pedigreed cockerels (Exhibition or Dorcas breeding), \$10, \$15, \$20, \$25, \$35.

Pullets and hens, \$7.50, \$10, \$15, \$20 and \$25.

Breeding pens, male and four females, \$40, \$50, \$75, \$100 and \$150.

Strong utility cockerels in lots of six or more, \$5 each; utility yearling hens, \$5 each.

a utility bird except in a showing of exception as an exhibition bird, its utility days having gone by."

That is at once a denunciation and an indictment by an Englishman of an English breed as bred by modern English breeders. What should have brought about such a decline of the Black Orpington in England and such a phenomenal advancement in the breed in a British colony? Thereby hangs a tale which holds a lesson for progressive American breeders.

The story starts with the late Wm. Cook of St. Mary's Cray, Kent, England. In eighties of the last century, he was living in the town of Orpington, county of Kent. He had crossed red ear-lobed Minorcas on black sports from Barred Plymouth Rocks, both sets of these off-colored birds having been rejected by their breeders and kept merely in laying pens. He then secured some clean legged Black Langshans, which were of no use whatever to breed birds such as were required by the Standard of the Black Langshan Club, and crossed them on his Minorca-

Fig. 1. An Early Type of Black Orpington Male, Showing the Langshan Character.

Rocks. This gave birds that were one-half Langshan; large birds, clean-legged, single combed, black plumaged, white skinned, and they were fine layers of large brown eggs.

Mr. Cook introduced his new fowls to the public in 1886, and named them "Orpingtons," after the town in which he lived. They became popular, and as time went on a multiplication of varieties followed. But the original Orpington was the Black Orpington. The black plumage was especially well adapted for poultry keepers in the outskirts of smoky London, and the hardihood, substantial size and useful qualities of the fowl were greatly in its favor.

Some of the ultra critical said that Cook's new Orpingtons were only "clean legged Langshans," and it is recorded that for a time some of the shows in England provided classes for "Langshans or Orpingtons," and the birds of both breeds competed together. Fig. 1.

About 1889, the distortion of the practical Langshan began in England, breeders starting off on the new line of producing high station and tighter feather. It was with the object of getting away from the Orpington that English Langshan breeders began to change the type;

A finer typewriter at a fair price

Over 800,000
sold

Was \$100

Before the War

Now \$64

You save \$36

Newest and finest Oliver

This is *not* a rebuilt or second-hand machine we offer. It is a new Oliver, latest model, and absolutely the finest product of our factory. It is the famous Oliver No. 9, the model that sold for \$100 before the war. And you have the guarantee of a \$2,000,000 company that it is the identical typewriter.

The Oliver is noted for its simplified and sturdy construction—for its freedom from trouble—for its year-in-and-year-out service and durability. It is distinguished for its handsome appearance, being richly furnished in nickel and olive green enamel.

Easy payments

Over a year to pay—Only \$4 a month

If you decide to keep the Oliver after free trial, pay us at the easy rate of \$4 a month.

This gives you over a year to pay, and you have the use of the typewriter while paying for it.

Think of it—payments so small as to average only about 13c a day! Our liberal payment plan makes it easy practically for everybody to own the Oliver typewriter.

Don't think of renting or buying a second-hand machine of doubtful quality when it is so easy for you to own the superb Oliver!

MAIL THE COUPON

The coupon brings you an Oliver for free trial. Mail it today.

If you wish further information before ordering, mark the coupon for our catalog and copy of our amazing booklet, "The High Cost of Typewriters—the Reason and the Remedy."

Avoid disappointment—order now to secure immediate delivery.

Canadian Price, \$82

The OLIVER
Typewriter Company

1971 Oliver Typewriter Bldg., Chicago, Ill.

Don't Send One Cent

Our amazing free trial offer

Try the Oliver free before you buy. Send no money. Make no deposit. Mail only the coupon to get the Oliver for free trial.

Use the Oliver for five days as if it were your own. Put it to every test, to every comparison. Satisfy yourself that if any typewriter is worth \$100 it is this superb Oliver with all its modern improvements.

If for any reason you decide that you don't want to keep the Oliver, just send it back at our expense (express collect). We even refund the outgoing transportation charges. So you can't lose a cent on the free trial. If you agree that it is the finest typewriter regardless of price, and want to keep it, take over a year to pay at the easy rate of only \$4 a month.

You save \$36 because you buy direct from the factory

A new Oliver nine, our latest and finest model, now only \$64. The identical typewriter that sold for \$100 before the war. Only our selling plan has changed, not the Oliver.

We now sell direct from factory to you. A sensible method, an economical method. We inaugurated this plan during the war, when economy was urged upon all of us as a patriotic duty. And we were glad to break away from the old system of selling typewriters. It was too complicated, too costly, too wasteful. It made the price too high.

We no longer have over 50 branch houses and sub-offices throughout the country. We save for you money that was going for high rents, employees' salaries, etc. We also save on traveling salesmen, whose salaries, commissions and road expenses had to be paid for in the price of the typewriter. Our new plan dispenses with these superfluous sales methods. The saving is \$36, and it goes to you.

Other prices went up with the war—the Oliver came down

Note how other commodities have soared in price since the first days of the war. Nearly everything has doubled or trebled in price. But the Oliver sells for \$36 less than before the war! That shows the economy of our maker-to-user plan.

Let others think that costly sales methods are necessary. As for us we are very well pleased with the Oliver plan. Our business has increased fourfold in the past three years. And today we are again adding to our manufacturing facilities.

What great concerns think of the Oliver

National Suit & Cloak Co., New York: "In our business, typewriters are kept busy eight hours of every day. It is necessary that we use machines that are not alone speedy, but those that will stand up under such conditions. It was for these reasons that we installed the Oliver, and are now using over 500 of these machines, having standardized in them."

Nau, Rusk & Seeveringen Co., Cleveland: "Our typing is of great importance in our work as public accountants. It is highly necessary that we get clean-cut figures, a perfect register, and the best possible copies. That's why we use Oliver Typewriters. The Olivers are 'on the go' constantly in our office. The operators have no trouble with them and find them very simple to operate."

Tropical Paint & Oil Co., Cleveland: "We find that the Oliver Machines stand up for years—and during their life they give us complete satisfaction. The downward striking type-bar—a distinctive feature of the Oliver—insures perfect alignment, which is always a great advantage with a typewriter."

Among other prominent users of the Oliver are: Morris & Co.; New York Central Lines; Boston Elevated Railway; Hart, Schaffner & Marx; U. S. Steel Corporation, and others of great rank.

Baker's Buff Rocks Won Every First at Kansas City and Chicago

Egg record, Leavenworth, 214; Mountain Grove, 229. 2,000 chicks growing. Best Buff Rock catalog ever issued FREE.

C. R. BAKER, Box A, Abilene, Kansas.

and they bred that the English became "a long, thin, and often weak-legged." Fortunately the disaster to the Langshan was not complete, and the true type of Langshan as bred in America, was fostered to some extent in England regardless of the change in fashion; and the English fancy is again returning to the pure type as imported originally from China by Major Croad.

Two years after the change took place in the Langshan, a change took place in the Orpington which was to separate it from the old Langshan type.

In 1891, the late Joseph Partington exhibited at the Dairy Show, London, two Black Orpington cockerels and two pullets that had heavy shanks, massive type for that day and splendid plumage. All four of these birds had nearly black eyes. Such birds had not been seen before and they won the first and second prizes in both the cockerel and pullet classes, and three of them were immediately sold for 30 pounds (\$150) each.

The Dairy is the young bird show of England, held in October, and fanciers are keen to visit it and see the fore-runners of the season's progress in breeding. The decisions at the Dairy are preliminary to the great Crystal Palace event, the Madison Square Garden Show of Britain.

At the Crystal Palace Show, a few weeks later, 1891, Partington brought out fresh birds that beat the previous winners. It was a sensational year for the Orpingtons. Breeders realized that there was something new and different

Fig. 3. Black Orpington Cock Owned by W. M. Bell, England, About 1904.

in Black Orpingtons, and in the subsequent scramble to get in on this new stock, much of the old Cook blood was abandoned.

There was not a drop of the blood of Cook's Orpingtons in the Partington stock. Partington was well known as a breeder of Cochins. He is said to have stated that his Orpingtons had come from crossbreeding, as had Cook's strain, but that he had started afresh with the idea of breeding something "more striking and handsome."

This Partington stock became undefeatable in the English shows, it soon dominated the yards of every Black Orpington breeder in England, and it was the foundation on which the full feathered Black Orpington of today was developed.

However, old Joe Partington, one of

the greatest breeders who ever lived, did not want Orpingtons so short-legged and down in feather that they became mud-bedraggled denizens of the poultry yard. His ideas were: "Legs not too long, thigh just showing; excessive fluff should be avoided as tending to decrease laying." His ideals are illustrated in Fig. 2, which shows a pair of his birds as pictured in 1902 by Harrison Weir, the master poultry artist of the old world.

Following Partington the next great English breeder to come upon the scene

Fig. 4. A Full-Feathered Black Orpington Hen That Won 1st at New York, 1911.

was W. M. Bell of Ringwood, Hants. He worked for a time on the farm of Wm. Cook, and when he started breeding for himself he had a type of bird shown in Fig. 3. The picture of this Bell cock was made in 1904. It shows a growing tendency to fuller lines.

Once the English fancy starts in any given direction it does not stop short of the goal. It bred faces on Spanish that were so long that the birds got tired holding up their heads when cooped in a poultry show; it bred station in Game bantams until the little birds walked around on stilts; and now it started in to breed rotundity and excessive feathering in Black Orpingtons.

Before the war, purebred poultry in England was a business that men played with. The nation secured its eggs from Denmark and Russia in the summer and Spain and Egypt in the winter. The breeding of purebred poultry was a fancy, a sport, and breeders based their ideals on prevailing fashions, not arriving at the ideals to which they bred with any concern for practical working poultry farmers whose needs, in a well order poultry husbandry, should influence if not control the operations of breeders.

The outcome of the craze of English breeders was long, profuse feathering as shown in Fig. 4. This hen would have become an English show. In reality the aims of the English breeders found supporters in both America and Australia, and the hen pictured won first at our own New York show in 1911. There was always more or less denunciation of this type of Orpington in America, and a hen whose fluff mixed up with the shavings in her coop, thus hiding her shanks and toes, came in for a great deal of criticism.

American breeders knew something

PARKS' STRAIN—BRED-TO-LAY BARRED PLYMOUTH ROCKS

Lead the World as Layers

Miss Graduate 313, Lady Martha 323;
Mis Smarty 325 eggs in year

They have over 31 years of Careful Selection, Trapnesting and Pedigreeing for EGGS back of them.

If you can't afford Foundation Stock, improve your present flock with our PEDIGREED COCKERELS. Like hundreds of others are doing.

From the ARKANSAS AGRICULTURAL COLLEGE under date of Nov. 23, 1920, Prof. Stout writes: "Mr. Parks—Perhaps it will be interesting to you to know that the bird we purchased from you two years ago has produced pullets that have laid over 200 eggs. These pullets were from hens considerably under 200 eggs."

SOLD OUT—We are about sold out on COCK BIRDS. Have only a few PEDIGREED HENS left. Still have choice selection of PULLETS; not over five to a customer, and have a GRAND SELECTION OF COCKERELS.

If interested in stock better act quickly, as these surplus birds won't last long.

Get your EGG and CHICK orders booked early.

Candee Sectional Incu-

The Only With the Double Control that Compels

**340 STRONG,
HEALTHY CANDEE-
HATCHED CHICKS
FROM 400 EGGS**

"I cannot say enough praise for Candee Incubator and Colony Brooder—the equipment is perfect. The chicks are the biggest and healthiest I have ever handled.

We could have sold in the neighborhood of 10,000 baby chicks. There has been a heavy demand for baby chicks and especially among farmers for six weeks old chicks. All the birds we produced are taken right here at home.

One hatch from 258 eggs I tested 44 clear and hatched 184 chicks—all strong, healthy birds and not even as much as a crooked toe among them. Another time I tested out 80 eggs from 480 and hatched 340 lively chicks from the remaining 400 good eggs. There may be operators doing better than this but I am thoroughly satisfied with the results.

Thanking you for your square dealings and unselfish methods, I am,"

Yours truly,

Abel F. Hankins.

EGGs positively cannot overheat in the Candee Incubator. The Candee patented double automatic temperature control compels constant correct heat no matter how many sections the incubator has or how many compartments are in use. The automatic regulator at the heater controls the drafts and keeps the water in the main supply pipe at the proper temperature continually.

Each 300-egg compartment—there are two to each section—has its own automatic temperature regulator that controls the flow of hot water from the main supply pipe into that compartment, admitting more or less hot water to keep the temperature in that compartment absolutely correct at all times during the entire hatching period. And the Candee Incubator is properly ventilated without chilling drafts and without robbing the eggs of their original moisture.

This double temperature regulation absolutely prevents overheating and when eggs never become overheated but always receive the proper warmth and ventilation, you can be sure of the best possible hatches of strong, sturdy chicks. You can be sure that your chicks will get the right start in life.

This double automatic regulation consists of a principle of incubation that is not to be found in any other incubator. It is the fundamentally right principle and is not an experiment—it was built into the first Candee Incubator and has never needed to be changed.

**600-Egg Candee Incubator
With Top of Section Cut Away
to Show Interior**

Note the automatic temperature regulator which keeps the temperature in this compartment constant and correct at all times by regulating the flow of heated water into the compartment. Note the four 75-egg trays with ample nursery room beneath. Note the substantial construction with double walls containing dead air-space insulation. Many of the largest poultry raisers in this country have started with an outfit exactly like this.

**AUTOMATIC
VALVE**

One of these valves is operated by the thermostat in each compartment. It controls the flow of hot water to that compartment.

Park, N. Y.

Incubators Build Success

Incubator

Automatic Heat

Constant Correct Heat

Start With One or More 600-Egg Sections—Add More Sections as your Business Grows

The Candee comes in all-built 600-egg sections. You can start your hatching and poultry raising business with one or more 600-egg sections. As your business grows, you can add all-built 600-egg sections one by one in a straight line like the 17-section incubator shown below, or you can extend sections to right or left, or place one machine above the other in double deck form.

Each section is complete with piping, partitions, etc. in place. Any handy man can set it up in a short time—no factory expert needed. Sections will pass through an ordinary door opening.

Each Compartment is Separate—Start Hatches at Any Time

As each 300-egg compartment is separate and distinct, hatches can be started and stopped in any compartment at any time without interfering with hatches in other compartments.

Write for Big Free Catalog—Get More Facts

There are many other reasons why the Candee gives the best results. They're all explained and illustrated in the big Free Candee Catalog—a book that is more than an incubator catalog—a guide and textbook to most productive poultry raising. Write for your free copy today.

CANDEE INCUBATOR & BROODER CO.

Dept. 2

EASTWOOD, N. Y.

Manufacturers of Incubators, Hot Water
Brooding Systems and Colony Brooders.

TWO CHICKS OUT OF EVERY THREE EGGS

"My Candee Incubator hatched two-thirds of the eggs put in. If my machine had been larger this season I would have sold two or three times as many chicks as I turned away orders nearly every day, and I could have sold every chick for 30c. All the chicks were bought by people here at home.

This was my first year with a Candee and I just want to tell you that I never had such nice pullets as I have this season, and I am sure that some of my birds will lay their first eggs before the first of October.

I am planning to give you an order for more sections to add to my present machine for next season if I can get my new cellar finished this fall in time so that I can have my machine set up for next season's work.

I have been breeding Single Comb Black Minorcas for some time and this season I have started in with White Minorcas also.

I want to thank you for your kind attention to my previous letters and for your free service to poultrymen."

Yours truly,

Lester R. Vining.

10,200-Egg (Seventeen Sections) Candee Auto- matic Incubator.

This incubator holds thirty-four individual 300-egg settings at one time.

Many poultry plants have Candee equipment of several times this capacity. The heater is tended just as quickly with a machine of this capacity as on the smaller sizes, and as each setting of eggs has its own automatic regulator, only a few minutes a day are required to look after the heater. When one considers the great saving in labor, as compared to an equal capacity of oil lamps, it will be readily seen why the Candee is used so extensively.

Candee Incubator & Brooder Co.
Eastwood, New York
Gentlemen:

Allow me to add a few more words of praise for Candee equipment. I had an opportunity to see a flock of 500 chicks I sold to one customer, as well as buying eighty head to slaughter, and these fellows were just as big and healthy as hen-hatched birds, and this man placed an order for next season for 1000 head. The basic superiority of Candee chicks is the fact that they are hatched right.

Yours very truly,
ABEL F. HANKINS

Marshalltown, Iowa

How Many Poultrymen Know What's in an Egg?

Here is a chemical analysis:

	Percent
Protein	13.5
Fats	17
Sulphur	2
Water	67.5

The combined Protein, Fats and Sulphur represent 32.5 percent of the egg; Water, 67.5 percent—107.7 percent more water than the combined other elements.

How then can a bird produce eggs if she does not have a continuous water supply? Let us answer it for you—she just simply can't and doesn't! A bird will not drink *ice water* any quicker than you would if you were working outside in cold weather. She requires it with the chill removed in order to consume sufficient quantities to supply 67.5 percent water for eggs and the necessary amount for blood.

Water is actually worth over 200 percent more to your birds than feed in egg production and is therefore actually worth in dollars and cents just \$2.08 to every \$1.00 you put into feed.

Now Mr. Egg Producer, get busy and keep water before your birds *all the time* at such temperature that they can and will drink it—not hot or warm water, that weakens them, but just right—not cold or not hot, but just with the chill off.

There are two ways of doing this—stay right with them all day long running back and forth with water or INSTALL NORWICH AUTOMATIC AIR LOCK FOUNTAINS, fill when empty and the machine does the rest. The fountain can't freeze; it has been operated in Alaska at 60 degrees below zero; and your birds are assured a continuous supply of fresh, clean water at exactly the right temperature and if they are watered but once a day at the present time **WE WILL GUARANTEE A 50 PERCENT INCREASE IN EGG PRODUCTION** by the use of the Norwich Automatic Air-Lock Fountains.

Pretty strong talk but **PROVEN ACTUAL FACTS.**

of the original Orpington. Black Orpingtons had been shown in the United States as early as 1891, and from then until 1900 scattering entries were made at different shows. Some of the original stock was in America, and while later importations modified the type of the original Orpingtons, giving the birds a desirable massive appearance, the blood of fluffy, squatty birds never completely absorbed the breed in America. It was different in England.

Some years ago we visited Orpington House in England. This is the home plant of Wm. Cook and Sons. Mrs. Clarke, daughter of the late Wm. Cook, commented on the fact that in America and Australia there were descendants of the original Orpingtons, which accounted for the good utility value of the variety in those countries.

But, in England, alas, the Standard for the breed was ignored, prizes were placed on extreme development of feather and shortness of legs; fertility seriously diminished; and some flocks of hens seemed to have a chronic diar-

A Black Orpington Cock of the Full-Feathered Type, Imported to the U. S. in 1914.

rea. Moreover, it was costly to buy feed to grow so much feather, and the English full-feathered Black Orpington became the center of interest of only a group of hobbyists.

In Australia some of the breeders proceeded to breed Black Orpingtons along practical lines, with such success that the variety is one of the most popular on the island continent, rivaling and at times excelling the Leghorn as a layer, and the equal of other large fowls as table poultry.

In America the outlook for the Black Orpington was for a time ominous; but last year the dawn of a new day broke, and the sun began to cast its beneficent rays upon the brilliant plumage of the Blacks, when a leading breeder of the west, Carl Byers, showed a pullet at the Chicago Coliseum that was of true Orpington type, yet not extreme, and Richard Oke, the foremost authority in the United States and Canada on Orpington type, placed her first over some Cochins-typed pullets.

We had not forgotten this pullet, or the action of Judge Oke when the reports of Black Orpingtons winning the egg competition in Australia reached us. We thought then that events seemed to unmistakably portend a bright day and fair weather for this grand fowl.

Still we hesitated. We waited for the birds of different breeders to come

GOLDEN-MASTERPIECES

Give the finest flesh, bone and feather interpretation of all that is good in breed character of American Orpingtons. Long, broad backs, full, rounded breasts, low, wide tails and standard station. Genuine massiveness of modern refinement. The soft, rich buff of lustrous mellowness, bred by men who stay in the game. All correspondence and selections promptly and efficiently handled by Floyd E. Wyant. Approval and C. O. D. shipments. Your best interests respected always.

together again. De-
cem see if
Byers would again show such a pullet
and if Oke would place her first in
preference to all others.

Our comment on Black Orpingtons in
the Chicago Show report, this issue,
tells what happened. And what hap-
pened, we believe, portrays the aims of
constructive breeders, the ideals of
helpful judges, and on this unmis-
takable tendency of the times is based the
heading to this editorial: "Black Or-
pingtons to Now Go Forward."

given during Farmers' Week at the Ohio
State University, Columbus, January 31
to February 4. For a copy of the pro-
gram address the College of Agricul-
ture, Columbus, Ohio.

* * *
Thos. F. Rigg.

Older readers of American Poultry
Journal know Thos. F. Rigg as a poul-
tryman. For years he was a contributor
to these columns, reporting shows, writ-
ing of breeds and breeders, and con-
ducting a department each month under
the standing heading of "The Fancier
in the Poultry Yard."

We have forgotten the weighty things
that he discussed in those years, for the
heavy things sink in the stream of time
and down the stream float the lighter
things such as the spirit of inspiration
that Tom Rigg breathed into what he
wrote.

We learned much from him. Perhaps
the most important thing was that a
poultry paper should carry inspiration;
that it is not enough to write an article
on how to feed to produce an egg, how
to gather the egg, how to market the
egg, and then surround that article with
advertising, and call it a page.

Another thing that Tom Rigg did
better than anyone who ever wrote for
the poultry press was to inspire a man
to face his problem and then not step
back from it, not sidestep it, but to step
into it.

His favorite recommendation to be-
ginners in purebred poultry used to be
that they buy a pair of birds and line-
breed the pair. We followed that ad-
vice and bought a cock and a hen. They
were a good pair of White Wyandottes.
The cock won 1st at Napoleon, Ohio,
1902, with a score of 95. He was cut
only one-half point on color. The hen
won 3d. There were 92 White Wyand-
ottes in the class.

Although this pair represented good
value for the money we had paid, we
were never quite satisfied, for the breed-
er of whom we bought the pair reserved
for his own use a better cock than he
sold to us. As a result, we failed to
give the chicks from these birds the
care that we should have given them.
An older man would not have been so
impatient. He would have taken the
tools at hand, used them with infinite
(Continued on page 36)

What Percentage of the Chicks Hatched Do You Raise?

Is your brooding system run on the hit-or-miss plan or are you sure that every chick you put under your brooders is being given the best care possible? Therein lies the secret of success in poultry keeping.

Don't experiment. It is too expensive. It is cheaper to learn from the experience of men who have made their names known all over the country through their wonderful success in the poultry industry.

Send today for illustrated catalog that tells you why the

International Sanitary Hover

is used and recommended by them and how it helped them to make good. It will be mailed you free. A postal card will do.

And the many features found only in the Sanitary Hover are fully shown in the catalog. You ought to know why it is warmest at the curtain; why the curtain is used; why only a canvas curtain and many other necessary things for the poultryman to know.

Your poultry supply dealer will be glad to show you the Sanitary Hover—The One Perfect Brooding Device.

pains, and ea
slip by we to
of what the
he is doing, except to gain inspiration
from his best efforts, and we are work-
ing harder with the material that we
have at hand.

Mr. Rigg is today counseling with those whose problems are bigger, those whose problems are questions of life—a home to live in, a garden, an orchard, some poultry.

Through the letters that he receives and prints in his horticultural department there runs something of the tragedy of life. So many of those letters are from men who have labored without vision of the future, while the sands

THOS. F. RIGG.

of early years have been slipping by, and now in the cool of the evening they wish for a warmer clime and for the soul of nature to make tolerable their existence. They turn to Rigg, who has lived a happy life, for a little of the glow of its reflection, hoping thereby to see and picture some of the beauty beyond the workshop and understand something of the happiness of living with a garden, an orchard and some fowls.

We know of no one better than Tom Rigg to point the way. He has made a success of his own farms in Iowa and Virginia. It is not often that a successful man takes the time and goes to the trouble to patiently answer inquiries and write generously out of his own knowledge and experience.

We hope that many young men are finding an appeal in Mr. Rigg's notes and will become interested not merely in farming but in modern agriculture. The one is joyless labor, the other is joyful work; the one is to employ brute strength and man power, the other is to study nature and work with her.

The more we know of nature, the greater becomes her fascination. Every time we set an egg or plant a fruit tree, there is a story for nature to tell us—a story of heredity in animal or plant life, a story of germination, of growth and development, of reproduction. Of the naturalist Agassiz it was written:

And he wandered away and away
with Nature, the dear old nurse,
Who sang to him night and day
The rhymes of the universe.
And whenever the way seemed long,
Or his heart began to fail,
She would sing a more wonderful song,
Or tell a more wondrous tale.

“Purina” Made the Difference!

THE basket on the left holds the eggs produced by the average good layer, fed Purina Poultry Chows as directed. The basket on the right holds the eggs the same hen lays when fed grains. Grains produce fewer eggs because they supply too much material for yolks and less than enough material for the same number of whites. To be balanced, a ration should contain material for an equal number of yolks and whites.

If a hen got no white-making material at all, theoretically she could not lay an egg. Do you wonder then that a grain-fed hen lays so few eggs? Just study the following table:

Compare Grains and Purina Poultry Chows

	Yolks		Whites	
100 lbs. wheat, corn, barley and kafir in equal portions, contain material for	239	147		
100 lbs. Purina Poultry Chows—Yolks Whites				
50 lbs. Purina Hen Chow	123	71	} 214	212
50 lbs. Purina Chicken Chowder	91	141		
Total for 100 lbs. of chows	214	212		

This explains how Purina Chows can be guaranteed to make more eggs than any other ration.

More Eggs Guaranteed With Balanced Purina Chows

The money paid for both Chows will be refunded if hens fed Purina Chicken Chowder with Purina Hen Chow, as directed, do not lay more eggs than when fed any other ration.

Feed from the Checkerboard Bag

When eggs are high is the time to make your biggest profits. Even though you could get all the ingredients used in Purina Poultry Chows, you would find it poor economy to mix such a ration at home. Feed from the Checkerboard Bag—it is your best assurance. Get Purina Chows from the Purina Dealer in your community. They will reduce your feed cost per dozen eggs. If you don't know who the Purina Dealer is, write direct to the Mills giving the name of the dealer you trade with and state the number of chickens you have.

Sold in Checkerboard Bags Only

It Will Prevent Water Freezing

This fountain can be placed outside in the coldest weather and your birds will be assured of water that will be of the right temperature. Don't chill your birds by allowing them to drink out of a fountain that forces them to break the ice to secure a drink of water. A chilled bird is a dead bird nine times out of ten.

Constructed with every precaution against danger of ignition. Simple and safe. So ventilated that the lamp will not blow out in the stormiest weather, yet all the time supplying just sufficient heat to prevent water from freezing. Made of heavy galvanized iron with lamp, complete in two sizes—2 gallon and 4 gallon.

Riebel Sanitary Double Seam Poultry Supplies

Made of the best grade of heavy galvanized iron, which enables you to use them not one year but many years. Write for prices. Our articles are of sterling merit and at low prices

Grit Boxes
Can be used for grit, oyster shell, charcoal and beef scrap. Made in three sizes.

FEEDING TROUGHS

for Feed, Water, and Wet Mash. Barrel top prevents wasting of feed, and if used for water does away with the drowning of little chicks. Made in three sizes.

Dealers! This is your opportunity to secure a guaranteed line of poultry supplies. Made of the best materials and workmanship. They sell on sight. Write today.

Fred Riebel & Company
6215-6221 Wentworth Ave., Chicago, Ill.

Mash Hoppers

Does away with all trouble of feedclogging, no matter how coarse. Made in three sizes.

Dispersal Sale at Sunswick Farm

Rufus Delafeld, proprietor of Sunswick Poultry Farm, announces a sale of his complete flocks of Buff Orpingtons and White Wyandottes. Heretofore large sales of this kind have been made at private treaty and the average man has not been let in on the secret until the details of the transfer were completed. Mr. Delafeld sets a new example for poultrymen in making a public announcement of his complete dispersal sale.

This sale is not being made because Sunswick Farm has been unsuccessful. The fact is that the farm is well established, its customers reside in every state, and the fine flocks that have been built up at Sunswick Farm have proved very profitable for their owner.

The trouble lies in the fact that the immigrants that enter the port of New York, instead of going west and settling on the land as of yore, are squatting at New York City's back door, and the land around Sunswick Poultry Farm is being broken up into building lots and peopled with newcomers from southern Europe.

The poultry fraternity can ill afford to lose the personality of Rufus Delafeld, and fortunately he is not to be missed. While not young enough to begin over again and start a new farm in another location, he will breed in a limited way at his residence in Plainfield, N. J., some other variety, if only bantams, for, with the spirit of a real fancier, he writes that he would not be able to let a spring season pass without setting a few eggs and bringing forth a few chicks.

* * *

R. C. Rhode Island Whites or White Wyandottes.

The National White Wyandotte Club meeting at Kansas City, Mo., during the Heart of America show, adopted the following resolution as presented by John S. Martin:

In 1918 egg laying contest at Mountain Grove, Mo., pen No. 12, classified as Rhode Island Whites and designated by band Nos. 12-1, 12-3, 12-4, 12-5, and substitute hen of band No. 12-6—this pen winning second place in the annual contest; and

Whereas, Charges were made and fully substantiated that the above named pen were White Wyandottes which had been substituted for Rhode Island Whites; and

Whereas, It is further charged and fully substantiated that the director of the Missouri Poultry Station did knowingly and willfully certify each month during the egg laying contest that the above pen, No. 12, were Rhode Island Whites, when he knew the White Wyandottes had been substituted,

Therefore we, White Wyandotte breeders, at our regular annual meeting, held at Kansas City, November 25, 1920, having carefully considered the charges and facts pertaining thereto; and

Whereas, We have carefully considered the resolutions to be presented for adoption for the Missouri Poultry Breeders' Association; be it

Resolved, That it is the sense of this club that said resolution be considered and adopted and that this club will sustain such action on the part of the Missouri Poultry Association as being conducive to the high moral plane so essential to the success of the entire poultry industry in America.

The following statement was made and resolution adopted by the Missouri Poultry Breeders' Association:

On June 4, 1920, the following charges were laid before the executive board of the Missouri Poultry Breeders' Association, with the request that said charges be laid before his excellency Governor Gardner, and that he be asked to order a strict and impartial investigation to be made by disinterested and competent poultrymen, so these charges might be either proved or disproved.

Whereas, In the eighth National Egg Laying Contest, conducted at Mountain Grove,

FOR TWENTY-FIVE YEARS

Cyphers Incubator Company

Incubators :- Brooders :- Hovers

Cyphers 1921 Catalog will be mailed upon request

BUFFALO

U. S. A.

NEW YORK

Mo., from November 1, 1918, to October 31, 1919, pen No. 12, classified as Rhode Island Whites and designated by band Nos. 12-1, 12-2, 12-3, 12-4, 12-5, and substitute hen band No. 12-6—this pen winning second place in the annual contest; and

Whereas, Charges were made that the above named pen were not Rhode Island Whites, but were White Wyandottes which had been substituted for Rhode Island Whites; and

Whereas, Further charges were made that in 1920, eggs were sold for breeding purposes purporting to be from White Wyandottes, from hens bearing the following band numbers: 12-1, 12-2, 12-3, 12-4, 12-5, 54 and 220; and

Whereas, It is further charged that the director of the Missouri Poultry Experiment Station did knowingly and wilfully certify each month during the egg laying contest that the above pen No. 12 were Rhode Island Whites, when White Wyandottes had been substituted; and

Whereas, The state poultry board, or a majority of its members, after due investigation, did not deny that White Wyandottes were substituted for Rhode Island Whites, but uphold the director in his deception of the public as pertaining to the eighth annual laying contest;

Therefore we, the members of the Missouri Poultry Breeders' Association, in annual meeting assembled, do deplore the unpleasant notoriety that has been given the state of Missouri in connection with the above charges, and that the Missouri State Poultry Experi-

ment Station is discredited among similar institutions of its kind in the United States and Canada, from the fact that the state poultry board has upheld the director of the state experiment station in his deception of the public, thereby destroying the confidence of the poultry breeders in future contests; therefore be it

Resolved, That his excellency the governor of the state of Missouri ask for and demand the resignation of any or all members of the state poultry board who voted to sustain the director of the state poultry experiment station in his deception of the public by such substitution of specimens untrue to breed, and for certifying falsely each month as to the true facts of the case. And be it further

Resolved, That a copy of these resolutions be sent to his excellency the governor of the state, and a copy be published in all principal poultry publications of the United States and Canada.

We are unable to pass on the merits of this case. For a long time it has been a more or less common opinion among outsiders that the Missouri Poultry Experiment Station at Mountain Grove has suffered from too much politics. From the fact that the members of the state poultry board, which body governs the state poultry experiment station, have sustained the action of the

station, it looks a little like more politics to get a new board and a new station staff. Be that as it may, if the birds were in reality White Wyandottes that were palmed off as Rose Comb Rhode Island Whites, they must have been very inferior Wyandottes. Perhaps "egg-type Wyandottes," which, goodness knows, means almost anything. There is no danger of a good Standard White Wyandotte ever being mistaken.

Partridge Wyandottes at Detroit.

A wonderful class of 294 Partridge Wyandottes was entered at Detroit, December 7 to 11. The National Partridge Wyandotte Club held its annual meeting during the Detroit show. It showed the right spirit of the fancy, and on motion of T. W. Schoen, discarded the club standard and henceforth all members will breed and show by the Standard of Perfection. The club, however, will request the committee which has in hand the revision of the Standard for 1923 to change the wording of the ground color of the females from "ma-

HALL

Quality

There has grown up about the HALL name a tradition of loyal performance and thrifty operation.

It originated, of course, with the early Hall owners.

But with the passage of time and the steady increase in Hall sales it has assumed correspondingly larger proportions.

So that today, after twenty-five years of infallible service, there seems to be almost a national conviction not only that the Hall is an exceptionally good incubator but that, in an investment sense, it is the true standard of value in its field.

Our new 52-page catalog written by Hall experts will convince you of the HALL QUALITY.

hogany bro a." This new te he beautiful co nd pullets of today. "Mahogany brown" has been something of a delusion; especially has it been a snare to many new breeders, entangling them in the production of too dark a ground color in their females.

Mr. McGrew effectively points out in his article in this issue of the Journal the mistakes of the past in breeding too dark a color. He emphasizes the matter of under color. Breeders were never more open-minded on this question of under color than they are today; indeed, there never has been a generation of breeders more anxious than the present generation to profit by past experiences. The result cannot be other than the finest Standardbred poultry that America has ever produced, and more breeders than ever before will participate in making the advances and thus produce and own some of the fine birds.

* * *

A New Book.

We announce this month in the advertising columns of American Poultry Journal the publication of a new poultry book entitled "The American Breeds of Poultry."

It has seemed appropriate that a comparatively large and exhaustive work should be written on the breeds that have been developed in the United States as a result of the genius of American breeders.

These breeds include the popular Plymouth Rocks, Wyandottes, Rhode Island Reds, etc.

With the firm conviction that a further extension of the breeding of all varieties of these great breeds is both practicable and desirable, we undertook the rather heavy task of writing what would be an authentic history of each of these breeds and setting forth the proper matings to be made in each of the varieties.

A large amount of additional material has been introduced into the book, the purpose being to equip the reader with a fundamental knowledge of breed origin, type, color, markings and mating.

Regardless of the fact that few new books are now being printed because only a narrow margin of profit can result after the prevailing prices for paper, printing and binding have been met, we have pressed the work to a conclusion and the books are now ready for distribution.

* * *

Nominations for A. P. A. Election.

Mrs. E. B. Campbell, secretary of the American Poultry Association, forwards the following announcement:

The nomination ballots for officers will be mailed from the office of the election commissioner, O. L. McCord, 825 Jefferson building, Peoria, Ill., February 1, 1921.

There will be elected this year officers as follows: President; vice president; boards of directors from districts Nos. 4 and 6 for one year; boards of directors from districts Nos. 1, 3, 5 and 7 for two years.

District No. 1 comprises the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut.

District No. 3 comprises the states of Michigan, Ohio and Indiana.

District No. 4 comprises the state of Virginia, West Virginia, Kentucky, North Carolina, Tennessee, South Carolina, Georgia, Alabama, Florida, Cuba, Porto Rico and the West Indies.

District No. 5 comprises the state of Minnesota, Iowa, Wisconsin and Illinois.

District No. 6 comprises the states of Missouri, Kansas, Nebraska and Colorado.

District No. 7 comprises the states of

J. WESLEY GARR,
E. Greenville, Pa.

NEW BUFFALO MAMMOTH

Capacity 3,600 Eggs. Floor Space 45 x 66 Inches. Height 80 Inches.

The Buffalo Mammoth is exceedingly simple in design and in operation. The air circulation is positive, all air passing through a 12-in. electric fan, which forces the air through definite and restricted channels. It is sufficiently rapid to distribute the warmth with absolute evenness throughout the machine. There are no "hot spots,"—not even near the radiator.

No draft strikes the eggs, which are placed in separate compartments between porous diaphragms, and which form lateral channels for the air circulation. The incubating chambers are thus ventilated by diffusion only.

Each tray compartment has an independent inner glass door making each 180 eggs a separate unit. One or more trays may be set at one time—the Buffalo is exceedingly flexible. The eggs are hatched in the same compartment in which they are incubated.

The egg turning device is simplicity itself. The roller tray used is the one I designed for the 20,000 egg Mammoth which I erected at Stroudsburg back in 1895. The actuating device is new, and all trays not hatching are turned by a single movement of a lever, on the long axis of the eggs, and without jar.

The eggs may be tested without removing them from the trays. A full complement of twenty roller and four wire bottom hatching trays furnished with each hatcher.

In the heat regulation I employ the successful Buffalo Thermostat, but double, yoked together, maintaining the sensitiveness, but adding power.

The Buffalo Mammoth has been tested out in the same scientific manner as was my original Cyphers Model and Buffalo. The regulation is as accurate and as simple; the diffusion method of ventilation is a proved quantity, and the fan circulation through definite channels insures a perfect distribution of heat. All features protected by letters patent.

Show Reports.

Should not a show report tell some-
thing more than "grand," or "won-
derful," or "elegant" about the birds
that great breeders exhibit and keen
judges place under ribbons? Are
breeders who cannot visit the show
not entitled to a view of the classes as
seen through the eyes of a reviewer?
We think so.

Moreover, we believe that they are
interested in some of the gossip and
talk that transpires on the floor of
the show room, even though it is not
quite the same in cold type as when
spoken in the impulse of the hour.

This fact, however, should be under-
stood. Only a great show can stand a
critical report.

A critic of the drama could not re-
view a cheap vaudeville act without
laying himself open for assault the
first time he went out on the street.
Only actors who are masters of their
art can stand criticism. It is the same
in poultry.

The wise reader will not jump at
hasty conclusions about a breeder or
his strain after reading a comment
that is based on one or two birds that
the breeder exhibited.

If you visited a show you would
talk with the breeder himself to learn
of what he had, and that would only
be second best to visiting the breed-
er's plant and seeing his entire flock.

A few birds on the firing line of a
big show do not tell the story of good
values for the buyer's money and a
satisfied customer. May we not sug-
gest, therefore, that the advertising
pages be noted carefully, and that the
reader send for the catalogs issued by
breeders of his variety. Read what
they say. Give them an opportunity
to talk with you about their matings
that are to produce the birds for
nineteen twenty-one.

* * *

Walter Hogan.

Out at Petaluma, Cal., Walter Hogan,
past seventy years of age, is farming
several thousand White Leghorns for
eggs.

Harry Lamont found him in the mid-
dle of the road, bare-headed, and Harry
got out of his machine, took off his own
hat, and had the accompanying picture
made. In the background are some of
Mr. Hogan's poultry houses.

Hogan has an investigational turn of
mind. The story has been told of Ar-
thur A. Peters, when in the govern-
ment service, going to see Walter
Hogan and finding him sitting on the
floor of his brooder house experiment-
ing with different colors daubed on the
brooder house windows, to see if the
rays of light could not be broken so
that the little chicks' toes on the straw
litter of the floor would not be so per-
ceptible that they would start toe-
picking.

Standard Reliable Incubators and Oil Burning Hovers

"Forty Years At It"

Standard Reliable Incubators

Forty years of success with the Reliable Incubators and Brooders is evidence of the quality of our goods. We manufacture everything that is needed on a well regulated poultry farm.

We Manufacture the Following:

Oat Sprouters
Non-Freezable Founts
Stock Food Cookers
Lice Killing Machines
Automatic Feeders
Feed Troughs
Grit or Shell Boxes
Brood Coops
A full line of Metal
Drinking Fountains, Incubators and Brooders and Oil Hovers.
Coal Burning Brooders
Many other articles which are positively guaranteed.

The Reliable Blue Flame Wickless Oil Heated Colony Hover

Burns Coal Oil
Steady Blue Flame
Comfortable and Easy to Operate
Economy of Operation
No Wick to Trim
Abundance of Heat
No Oil Fumes
Visible Oil Feed
Convenient and Safe
No Coal Smoke or Gas
The Flow of Oil is Regulated Automatically.

This is the most popular and most efficient hover ever manufactured, as proven by the many testimonials received. You can always get coal oil, but it is hard to get hard coal. You can get any amount of heat with these hovers that is needed at all times.

Thirty thousand Reliable Blue Flame Wickless Oil Heated Colony Hovers sold last season, and every customer satisfied and is a booster.

Can be operated successfully without a lighting ring by generating burner with alcohol or gasoline, but burns less oil by using asbestos lighting ring. We furnish lighting rings with each outfit.

The following are a few of the many thousands of successful users of the Reliable goods. Write them and find out how they like them.

We furnish a one-gallon self-feeder so that you need have no fear of light going out, for it is simple and requires very little attention. It is equipped with a safety valve. After the valve is once properly adjusted you need not pay any more attention, for it regulates the drop of oil. Our ventilator in top of cone of hover leaves out all foul air made by the chicks. This is done automatically, without any bother to the operator, and which insures steady and healthy growth of the chicks placed in its care.

By using the Reliable Blue Flame Wickless Oil Heated Colony Hovers you save time, money and trouble, and your chickens will grow faster, get heavier and thrive because our hover will take the very best care of them, and keep them comfortable, happy and healthy.

Our guarantee is that any goods bought of the Reliable Incubator and Brooder Company will do as we claim for them. If not, and returned by the purchaser within sixty days, your money will be refunded.

Send for catalog and prices. It's free. Address:

LAI D OVER 300 EGGS Per Year for Two Successive Years

KEYSTONE MAID
1918-19, 306 EGGS

LADY VICTORY
1917-18, 304 EGGS

1920 OFFICIAL CONTEST WINNINGS

Again Prove Superiority of
PENNSYLVANIA POULTRY FARM
200 to 300-Egg Layers

S. C. W. Leghorn
"LADY SNOW"
leads all birds of all breeds in 1919-1920 North American International Egg-Laying Contest. Lays 287 eggs—one of the highest records of the year, world over—defeating 500 layers of all breeds.

S. C. W. Leghorn
"SUPER MAID"
leads all Leghorns in American Egg-Laying Contest at Leavenworth, Kansas, 1919-1920. Laid 272 eggs in one year. Laid 130 eggs in the five most profitable egg months of the year.

S. C. R. I. Red
"RED ROSE"
Champion of all Reds in 1919-1920 North American International Egg-Laying Contest. Laid 254 eggs in one year. Highest individual Red record and third highest bird in entire contest.

OUR PENS AGAIN ON TOP
in 1919-1920 American Egg-Laying Contest
at Leavenworth, Kansas. We had in this international contest
HIGHEST PEN ON BOTH LEGHORNS AND WYANDOTTES

Out of the five highest pens in this contest, Pennsylvania Poultry Farm took two places, competing against pens from all over this and foreign countries. No other breeder made so high a showing—further proof of our superiority. Our Pen of Five Leghorns, containing "SUPER MAID," defeated all Leghorn Pens from America and England. Laid 1197 eggs in one year. Laid 133 eggs in the cold 29-day month of February, out of a possible "perfect score of 145." Our Pen of Five Wyandottes, laid 1103 eggs per year, defeating all Wyandotte pens in entire contest.

THE PENNSYLVANIA POULTRY FARM 1920 OFFICIAL CONTEST WINNINGS
A feat consistent with its highest official records year after year in contests. Since 1913 it has won more contest prizes than any two or three competitors combined; proving that its strain is

THE MOST PROFITABLE POULTRY KNOWN
Stop and Consider what it would mean to you to introduce into your present flock some hatching eggs, day-old chicks, fine cockerels or breeding stock from this highest-profit strain. Others may claim superiority; we prove it by

Official Contest Records Year After Year
—not on one breed only, but on all three breeds. Leghorns, Reds and Wyandottes. You know that this is the proved strain you need to improve your present flocks—or to start your new poultry venture right. Get your Orders in Early—stock is limited. Last year we had to return money on many orders we could not fill. Act now. Write for our helpful book "The Story of the 300-Egg Hen," price 10c deducted from first order. Avoid disappointment. A small deposit will hold any order for delivery any date you may specify.

PENNSYLVANIA POULTRY FARM

Box A America's Foremost Breeders of Hens That Lay Lancaster, Penn.

Hogan is best known by his system of picking out good and poor layers as set forth in his book, "The Call of the Hen." This book is one of the best sellers in poultry literature. In it Hogan makes what has been termed "the greatest contribution that any poultryman has ever made to the poultry industry." Although he carries his ideas too far, that is a privilege of an enthusiastic inventor.

The big basic facts as developed by Hogan are that a good layer has thin, flexible pelvic bones and a large, roomy, soft abdomen, while a poor layer has a small, contracted abdomen, which shows small intestinal development for the assimilation of feed, and the beef type,

Harry Lamon of the U. S. Department of Agriculture and Walter Hogan, discoverer of the Hogan system.

which converts its feed into meat rather than into eggs, has thick, lumpy pelvic bones. These are the outstanding fundamentals of the Hogan system.

Mr. Hogan would carry it further. He injects phrenology into his scheme of measurements and attaches significance to the formation of the skull. He seeks to reduce to mathematical accuracy his measurements for egg capacity. Thus, a hen with five fingers capacity between end of breast bone and pelvic bones, with a one-half inch thickness of pelvic bone, is said to have an egg capacity of 145 eggs; whereas if the pelvic is one-sixteenth inch thicker, she has an egg capacity of 130 eggs.

Many breeders are enthusiastic about these measurements of hens and cite some very remarkable instances of the figures as set forth by Hogan being substantiated by trapnest records. It would seem, however, that accuracy becomes doubtful when the problem becomes so detailed; but we do pay tribute to Walter Hogan for having given to the poultry world the best known method for determining the correlation between the external qualities of a hen and her potential egg production.

It is false economy to winter thirty hens in a house only large enough for twelve. The twelve hens will lay more eggs and eat less feed.

RECORDS OF A FARM FLOCK.

Greatly lowered prices for corn and hogs are causing many anxious moments for corn belt farmers. They are asking, "What is Profit," and if they have kept book accounts they are comparing yields and receipts from their various lines of operation. Are there any profits—and where?

Through all the ups and downs of market fluctuations the farm poultry flock, where given a fair chance, has proven a money maker. It is hard for many farmers to believe this, for they have been at least indifferent to the farm poultry business, turning over much or most of it to the wife or children. On most farms few poultry records are kept, which perhaps accounts for the indifference.

The record of an Indiana farm flock as here given is especially interesting this year. It is the record of a flock of Standardbred Barred Rocks on a general purpose live stock and grain farm in one of Indiana's famous corn counties—Johnson county. The Misses Long, who have kept these records for the Poultry Extension Division of Purdue University, have kept the house and cared for the chickens, while the brothers have done the general work, occasionally lending a hearty assistance with the poultry work.

The fiscal year of this flock began Nov. 1, 1919, and closed Oct. 31, 1920. The average number of hens for the year was exactly 181, based on a monthly count. The financial records follow:

RECEIPTS FOR YEAR.

1,372½ dozen market eggs sold.....	\$ 503.25
Hatching eggs sold.....	173.17
All poultry sold.....	323.49
Value of poultry and eggs eaten.....	77.93
Total receipts.....	\$1,077.84

EXPENSES FOR YEAR.

Actual feed cost, hens and chicks....	\$ 499.24
Miscellaneous expenses.....	66.35
Loss on inventory of stock.....	47.00
Interest on investment, 6% of \$1,000.....	60.00
Depn. on equipment, 10% of \$560.....	56.00
Overhead expenses.....	37.50
Total expenses.....	\$ 766.09

SUMMARY.

Total income.....	\$1,077.84
Total expenses, not counting labor....	766.09
Net labor income.....	\$ 311.75
Labor income per hen.....	1.72
Average price market eggs.....	.367
Total hours of labor.....	634
Labor income per hour.....	.49

It would be possible to juggle these figures and make a much greater profit, but it would be a profit "on paper" only. For example, by placing a greater value on the stock now on hand—as compared with the stock on hand last year—the "Loss on Inventory of Stock" could be changed to a gain.

Also interest on investment, depreciation and "overhead" are seldom charged against chickens on corn belt farms, yet if chickens are a part of the farm business these charges should be made. "Overhead" expenses can be considered as rental of three acres of land, or to express it in another way, it is the hens shares of the farm taxes, interest, depreciation, telephone rental, and other general farm expenses.

As several other items may be questioned by inquisitive American Poultry Journal readers, a few further explanations may be in order. The hatching eggs sold did not bring fanciers' prices,

most of them being sold to neighbors without advertising. Yet these sales helped obtain a fair price for eggs during the flush spring season, proving that Standardbred poultry pays, even on the farm, for this extra gain could not have been made had the stock been of inferior quality.

The average price of market eggs given in the summary is obtained by dividing the total amount received for market eggs by the total number of dozens sold. It is of value merely to compare one year's prices with those of another, or with another flock the same year.

In charging interest on investment it is figured that one monthly income will average to take care of all feed bills, hence interest is charged only on money invested in buildings, equipment and chickens, averaging the value of the chickens during the year. The poultry buildings will need repair and the equipment will wear out. The chickens must pay for these things, hence the depreciation charge.

The loss on inventory of stock was occasioned by careful culling of the flock, and is indicative of good poultry management, as the flock was reduced slightly to prevent overcrowding the poultry houses.

The hours of labor were kept for a portion of each month, then from this partial record estimated for the remainder of the month. Such records, of course, are not absolutely accurate, but they were faithfully kept and give a very fair indication of the labor expended. Dividing the total labor income by the hours of labor gives 50 cents an hour return for every hour of labor. Certainly not "a royal road to wealth," yet a very fair return for the time.

The egg yield is particularly interesting. Stated in terms of "average eggs per hen per month" it runs as follows: November, 1919, 1.8 eggs per hen; December, 1.6 eggs; January, 1920, 2.3 eggs; February, 3.5 eggs; March, 12.6 eggs; April, 15.1 eggs; May, 14.8 eggs; June, 11.0 eggs; July, 11.9 eggs; August, 10.7 eggs; September, 9.8 eggs; October, 7.7 eggs; or just over 100 eggs per hen (average for every hen on the farm regardless of age) for the year.

Very few winter eggs were laid. This is a condition existing on a great majority of corn belt farms, and if this fact could be impressed on the city consumer it might cause a better understanding of the high winter prices of strictly fresh eggs.

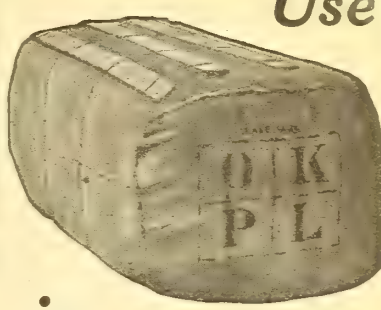

It is the writer's opinion, based on quarterly visits to this farm, that this flock will show an even better egg record this coming year. Certain improvements, such as culling and better feeding, have been made which are not indicated in the financial statement this year, but which should help make even more profit next year.

This record has been made public with the idea that it will be of interest because conservative. (Many times only the extraordinarily good records find their way into print.) Its perusal is especially recommended to the man who thinks farm poultry raising is a necessary and unprofitable nuisance, not a legitimate part of the farm business.

LeRoy L. Jones,

Extension Poultryman, Purdue University, Indiana.

Let Me Give You In Profitable

Why guess—and take chances in poultry raising? Why do that—when you can be sure and secure? My 1921 Book gives you the experience of 28 years as a guide to success and a guard against mistakes.

It's a book that I wrote myself. Just a plain, simple, straight-from-the-shoulder sort of a catalog. And it gives you every fact that I have been able to learn about making a good success of poultry-raising—and *all* that all the tens of thousands of Old Trusty users have learned—during the last 28 years.

It will be a mighty good book for you to have. And I'd be glad to send you a copy. My heart is in this chicken-raising business. I want to see every man, woman and growing boy and girl raising chickens and getting eggs and poultry for the family's use—or for the market.

That *would* be a fine thing, wouldn't it? And—since my book **WILL** help you, just you send for it today. Then—get an OLD TRUSTY Incubator if you think that that is the right thing for you to do. Don't—if you don't. I won't begrudge the book and the help and information that it **SURE** will give you. But, between you and me, friend,

Why Pay High Prices for Eggs and Table Chick- ens When You Can Grow Them Yourself At One- Fourth Market Prices?

We've got to produce more, you and I. Let me show you how you can laugh at high market prices. I know you are interested in poultry, but do you know how interested you could be in making your poultry more profitable? Let me answer the question for you with this book.

My 1921 Book tells you how to cut expenses, which means more and better poultry for less cost. It tells how to avoid mistakes and what steps to take to practically insure success from the start. Every move you make is explained—and outlined—and made easier for you. That book will make you *want* to go in for poultry raising, either for your own family's sake or for market profit, whichever you choose.

And—you'll get a lot of enjoyment and information through reading it—**SO—USE THE COUPON—AND SEND FOR MY 1921 BOOK TODAY.**

850,000 Customers Say—

M. M. Johnson
Inventor of Old Trusty

28 Years Start Poultry Raising

Over \$1,000,000,000.00 (One Billion Dollars) of poultry was raised in America last year.

If you raised any, you shared in the profits.

If you raised none, you took good money right out of your pocket and paid it to the people who were wise enough to produce chickens and eggs for the market.

I honestly believe that you are paying *more* for an Old Trusty Incubator by not having one than you would by having one. You see, I know that if you did have one that it would pay you, instead of you paying profits to people who have "Old Trustys."

Ever think of it that way?

Do you know that poultry usually pays half the living expenses or more in most homes where poultry is raised? Do you realize that the Poultry and Egg crop of America represents more money than the Oats crop—and practically twice as much as the Potato crop—and almost three times as much as the Orchard Fruits crop? Get the facts given you in my 1921 Book and you'll find them surprising and inspiring. They'll show YOU what you can do with poultry.

One woman in Minnesota says: "I make more money from my poultry than my husband does on his pure-bred hogs." Another woman—one in Oklahoma, states: "While my husband is busy farming I make profits at home with OLD TRUSTY." And still another Johnson customer in Missouri, reports: "We sold \$3,000.00 worth of eggs in the local market in the past three years."

Friend, it's hard to dodge facts like these. Why dodge them? Why not investigate them? You can do so, just by getting my 1921 fact-packed Book and reading it in your leisure time. I am sure that you'll find it interesting. And—I know that it is bound to be helpful.

"You Can't Beat Old Trusty"

Here's Good News! I Can Save You Money on the Price!

That's because I have built the Old Trusty in such immense quantities—have purchased materials in such huge lots—and perfected and enlarged my manufacturing facilities.

If this wasn't the largest incubator manufacturing establishment in the world and the demand for Old Trusty the largest ever known in the incubator history, you couldn't buy an "OLD TRUSTY" for half again as much as my 1921 prices.

I have never stood for "profiteering" notions or big city ideas on Old Trusty prices. I am a small town man—as possibly you are, and I am willing to live and let live. I am content with a fair profit and please more satisfied customers.

But—GET MY 1921 BOOK—and 1921 Price List and you will see for yourself what a square, fair deal I am giving you.

to fool himself, did not place a ribbon on a bird that had been so manipulated. This Buff Leghorn exhibitor who faked didn't get away with it.

In Black Minorcas, there were bent tails, and prizes were placed on birds whose tails had been bent down. We especially mention this class because the president of the Chicago show was showing in it, and the class should either be an example to other exhibitors in the show, or be made an example of. The judge has it within his power to throw out such birds, and it should be the business of the judge to do it. When he does not do it, he is not big enough for the job.

There are men who are devoting the best years of their life to poultry, whose lifelong friends are poultrymen, whose future is inseparably wrapped up with purebred poultry, and they are glad to see the higher standards of right that are being raised, and to know that the shows today are freer of over-conditioned birds than ever before in their history. When you find a handful of birds in 3,300 that are plainly wrong, when you find only a few exhibitors in nearly four hundred whose vision is blurred by a fatal ambition to win, we should be proud of our industry and the men who make it. We cannot hope to remove the frailty from human nature, but we can hit bad practice hard whenever it shows its head. Good fanciers, however, will not give circulation to slanderous stories that injure the good name of so wonderful and charming a business as the production of more beautiful and more useful creatures in God's feathered species.

STUDENT JUDGING CONTEST.

The Missouri, Indiana and Iowa agricultural colleges sent judging teams, consisting of three men each, to the Coliseum show, and each team judged four classes of four birds each for both egg capacity and Standard quality. The Missouri team, composed of students Seaton, Gordon and Henderson, won first; second honors were awarded to the Purdue team, and third to Iowa. A \$75 trophy went to the winning team, and a gold medal was awarded to Seaton as the high man, a silver medal to R. E. Roberts of Purdue as the second best judge, and a bronze medal to Gordon of Missouri as the third high man in judging. The prizes, representing a total cost of \$125, were donated by the poultry and egg shippers of the middle west.

THE NEXT COLISEUM SHOW.

Part of the success of the Coliseum show is due to the fact that the management is always a little ahead of time. The show dates are announced early, judges are engaged early in the season, the premium list is in the mails early. During the show the directors met and decided on the dates for next year, which are December 6-11, 1921.

The Leghorn and Minorca breeders requested double coops for their males, and these will be provided at the next show. This is the most generous action that any show association has ever taken. The Minorca is so large a bird that it needs a big cage, and the plumage that lies back of the center of a White Leghorn male is too important to be continually brushed against the sides of a single coop.

The following judges have been engaged for next year, and their classes are as follows: D. W. Young, White Leghorns; Herman Rickoff, Brown Leghorns; Walter Young, S. C. Rhode Island Reds; J. C. Johnston, R. C. Rhode Island Reds, S. C. Buff Leghorns and Buff Wyandottes; Richard Oke, Orpingtons; F. G. Cook, Barred Rocks; Charles McClave, Anconas. Each one of these men, without exception or qualification, did good work this year, and Secretary Hewes has shown his appreciation of their capabilities and conscientious service by re-engaging them without delay.

AWARDS AND COMMENTS ON THE CLASSES.

Barred Rocks (Exhibition)—Cowen & Pattison, Waterloo, Iowa, 1-2 cock, 2 chl; J. Y. Stimmel, Payne, O., 3 cock; Dell George, Emington, Ill., 4-5 cock; Wm. N. Hess, Antigo, Wis., 4-5 hen; E. E. Bennett, Warren, Ind., 1 hen; Mrs. M. G. Curd, Saverton, Mo., 2-3 hen; Wm. Hayner, Livingston, N. Y., 5 chl, 2-4-5 pl; M. J. Temkovits & Son, Cleveland, O., 4 chl; D. F. Palmer & Son, Yorkville, Ill., 3 chl; J. D. Veach, Helena, Mont., 1 chl; Louis Rauch, Creve Coeur, Mo., 1 pl; Thos. Saatkamp, Staunton, Ill., 3 pl.

Barred Rocks, Cockerel Bred—Cowen & Pattison, 2-3 hen, 2 pen; M. J. Temkovits & Son, 4-5 hen, 5 pl; Dell George, 1 hen, 1-4 pl, 1 pen; J. Y. Stimmel, 2 pl; J. D. Veach, 3 pl; Mrs. John Demchok, Sheridan, Wyo., 4 pen; D. F. Palmer & Son, 5 pen; Mrs. A. G. F. Stice, Mt. Pleasant, Ia., 3 pen.

Barred Rocks, Pullet Bred—Fred H. Shellabarger, West Liberty, Ia., 3 cock; D. F. Palmer & Son, 1-2-4-5 cock, 2-3-5 pen; Wm. Hayner, 1-2-4 ckl, 1 pen; Louis Rauch, 3 ckl; Thos. Saatkamp, 5 ckl; Mrs. M. G. Curd, 4 pen.

Rose Comb Barred Rocks—J. I. Niswander, English, Ia., 4 cock, 1-4 hen, 5 ckl, 2-5 pl; S. B. Wenger, South English, Ia., 1-5 cock, 2-3 hen, 1-2 ckl, 3-4 pl; Rev. W. S. Hoke, Monticello, Ill., 2 cock, 1 pl; Isaac Green, Pemberton, O., 3 cock, 3-4 ckl; Fred L. Seager, Randolph, N. Y., 5 hen.

There was a marked improvement in Barred Rocks over last year. In exhibition hens there was only one that lacked a tail. There was a completeness of condition that made the birds look like real chickens, and they appealed to the people. The winning hens were an even lot, bright barred and straight barred. In cockerels the 1st was a finished bird, not full of chick feathers, and had a grown tail. The 3d cockerel was young for this class, but full of quality. We were glad to see the preference given to birds that were ready.

In cockerel bred females there was only one this year that had curling feathers in her back. She was not placed. First exhibition pullet, a thrifty, useful chicken, in full bloom, and a credit to the grand breed. Those pullets had no chance in this class that were not uniform in barring. The barring had to be consistent in all sections. Narrow barring in back and wide barring in wing bow put such a pullet out of the running, no matter how straight barred or good underneath. The same kind of clean cut barring all over was necessary.

There was a good showing of pullet bred males. We believe that the bringing of these birds into the show is working good. Those light males that are inclined to slipped or twisted wings, or are very slow to feather in tail, are finding themselves at more of a disadvantage in the showroom than in the breeding yard behind the barn. The 1st young pen of Barred Rocks was the best ever shown at Chicago.

There was quite a class of Rose Comb Barred Rocks, and a committee composed of Fishel, Quisenberry, Stier, Pape, and Hewes agreed to recommend their admission to the Standard. About all the quality in this sub-variety is secured by throwing regular Barred Rock blood into it; and at that, the Barred Rock breeders are making the greater progress, although they have to develop what they get, and cannot take the short cut of the rose comb men and grade up by crossing.

The Barred Rock breeders should feel greatly encouraged by the progress that they are making. Those clean cut, straight bars on well finished chickens that have that intensity of life found only in good rugged stock in which the vital fire burns brightly, are a reassurance to those who were so disappointed in the class last year. In passing, we should say that the days of the dark, metallic male have passed. The order of the hour is a clear tone of blue color.

Buff Rocks—Mrs. H. G. Barker, Indianapolis, Ind., 1 cock, 2 hen, 5 pl; C. O. Dillingham, Sullivan, Ind., 2 cock, 1 hen, 3 ckl, 3 pl; E. H. Lichtenwalter, Girard, Pa., 1 ckl, 1 pl; Mrs. Alice W. Hampton, 5 ckl, 4 pl, 2 young pen; Rothbegg Bros., Milford, Ill., 2-4 ckl, 2 pl; Robert Marten, Billings, Mont., 1 young pen.

Cockerels and pullets were the best of the Buff Rock class. Here we see soft buff color and clear wings and tails. First cockerel and pullet quite typical.

Partridge Rocks—W. E. Mahle, Waseca, Minn., 1 cock, 1 hen; Chas. A. Buck, Stewartsville, Mont., 2 hen.

A small entry of Partridge Rocks. Chicago used to coop big classes of this variety. There is an opportunity for a big breeder of them in the west today. The Reds are getting all of the recruits, but a Partridge is more than a Red; it is a Red with beautiful black pencilings on the red ground color.

White Rocks—W. Clayton Thomason, Georgetown, Ky., 1-5 cock, 5 hen, 1-4 ckl, 2 pl, 1 old pen, 1 young pen; Adam F. Polt, Hartford, Wis., 2-3-4 cock, 1-2-3 hen, 2-3-5 ckl, 1-3-4-5 pl, 2-3-4 old pen, 2-3-5 young pen; F. W. Breimer, Streator, Ill., 4 hen; Mrs. Mattie Webster, Woonsocket, S. D., 4 young pen.

A good class of White Rocks. First cock large and typical White and with a very smooth texture of plumage. First hen was as good a hen as we have seen win at Chicago. First cockerel like 1st cock, but split somewhat in tail—a point that White Rock breeders must watch if they are not to get tails that are split apart. All five placed pullets were nice.

Black Java—J. Lee Thompson, Mason, O., 1 cock, 1 hen; Henry C. Turck, Chicago, Ill., 1-2 ckl, 1-2 pl.

Some good quality, particularly in cockerels and pullets.

"Link" Orr Says—

"I know poultry; most poultry folks know me; I have been in the field a long time; have covered a lot of territory; have made thousands of warm personal friends who are enthusiastic poultry raisers and I say this to you now: You will profit from reading the pages of this book—even though you never owned a chick."

—Extract from personal letter by Mr. Orr in the Book.

How to Raise Poultry for Profit

GEO. W. HACKETT
1st Vice-Pres.

ARTHUR A. PETERS
2d Vice-Pres.

JOS. W. KINGHORNE
Sec., Treas. & Mgr. Div.

A 48-page book on Poultry Raising, and profit-making from every branch of the industry: Hatching, Brooding, Feeding, Housing, Breeding and EGG PRODUCTION, especially in winter.

The Book, published by The National Poultry Institute of Washington, D. C., also tells you why such men as D. Lincoln Orr, Jos. Wm. Kinghorne, Arthur A. Peters, Geo. W. Hackett, Ed. L. Layes, F. W. Kazmeier, Albert Angell, Jr., Harley Williams and other nationally known leaders in Poultry, have pooled their experience, their knowledge, their energy and their resources to give to the world a thorough, up-to-the-minute

PRACTICAL COURSE IN POULTRY RAISING

for city, town or farm, and to render a distinct Individual Service to poultry raisers.

The tremendous advantage of our practical poultry course is the fact that it was written by practical and nationally known poultry authorities, whose combined services, or whose instruction, one could not, as an individual, afford to buy. The vast store of knowledge and experience of the officers and advisory board of the National Poultry Institute are now available to you at a small cost. Considering the value you receive the cost is as nothing.

Now Is the Time

The season is at hand. The industry has grown so that poultry raisers who **Know How** are making large profits, and are expanding. **PREPARE NOW FOR THE SPRING HARVEST.** We will show you **How to Raise Poultry for Profit**, and **How to specialize** in any branch or breed. We give you

Our Ironclad Guarantee

that you will be both satisfied and pleased. This signed guarantee protects you in the assurance that you have much to gain—nothing to lose. The cost is low; it is fixed; one price to all. But the Course is worth more than money to you. IT MEANS SUCCESS. Send for the free book today. Lose no time. The book gives details, and shows many illustrations; second edition just off the press. The book is free, without any obligation on your part. Use the coupon, or send a postal, but **DO IT—NOW.**

No. 4 Poultry House for 200 hens—5 units
No. 3 Poultry House for 30 hens

Silver Wyandottes—A. & E. Tarbox, Yorkville, Ill., 1-2 cock, 1-2 hen, 1-2 ckl, 1-2 pl, 1 old pen, 1 young pen; W. D. Topp, Tupelo, Miss., 3 ckl, 3 pl, 2 old pen, 2 young pen.

A small showing of Silver Wyandottes, the big show having been held the week before at Milwaukee, where something like 200 Silver Wyandottes were cooped. The cockerels and pullets were well grown, but we would like a little better lacing in both hens and pullets.

Golden Wyandottes—J. S. Pennington, Plainfield, Ill., 1-2 cock, 1 hen, 1 ckl, 1 pl; Chas. D. Love, Waukesha, Wis., 3 cock, 2 hen.

No noticeable improvement in Golden Wyandottes, with exception of 2d hen, which was of good type, rich ground color and beautifully laced.

Silver Penciled Wyandottes—Alvin H. Staat, Norwood Park, Ill., 2 cock, 1 hen, 1 ckl, 1 pl; Thos. W. Harwood, Batavia, Ill., 1 cock, 2 hen, 2 ckl, 2 pl.

Good color and type in the Silver Pencils; not many, but an attractive addition to the show.

Partridge Wyandottes—Sheffield Farms, Glendale, O., 2-4 cock, 1-2-3 hen, 1-2-3-4 ckl, 3-4 pl, 1 old pen, 1 young pen; E. G. Lapham, Elkhart, Ind., 5 cock, T. M. Mason, Cedar Rapids, Ia., 1-3 cock; W. L. Bender, Angola, Ind., 5 hen, 5 ckl; Dr. G. S. Culver, Sandwich, Ill., 4 hen, 2 old pen; J. H. Alexander, Ashland, Ky., 1 pl, 3 old pen, 2 young pen; C. R. Kreidler, Kansas City, Mo., 2-5 pl.

Keen competition in Partridges. First cock a big, coarse bird, lacking in saddle striping. First, 2d, 3d hens of the right shade of color and well penciled. A trio of wonderful matrons. The cockerels as a whole approximated the right shade of color, being bright in ground color and showing an effort to get evenness of ground color. First pullet stood out. Fine type, in good flesh, beautifully and clearly penciled; ground color free from shaftiness and mealiness, but one shade dark.

Columbian Wyandotte—H. R. Chance, Pine Island, Minn., 1 ckl, 1 pl.

A disappointing and inferior showing.

Black Wyandottes—Ralph Roudebush, Arcadia, Ind., 1-2-3 cock, 1-2-3 hen, 1-2-3 ckl, 1-2-3 pl, 1 old pen, 1 young pen.

Black Wyandottes have at least one good friend in the west. With proper promotion and fair dealing, the variety should go forward.

Buff Wyandottes—Utley-Sturtevant, Downers Grove, Ill., 1-3-5 cock, 1 hen, 3-5 ckl, 3-4 pl, 1-3 old pen, 2-3 young pen; Chas. Howison, Sandwich, Ill., 2 cock; E. H. Cabeen, Hope, Ark., 4 cock; J. H. Clark, West Pawlet, Vt., 2 hen, 1 ckl; J. R. Love, 3 hen; S. A. Howland, Granville, N. Y., 4 hen, 4 ckl, 1 pl; D. Louis Grey, Ravenna, O., 5 hen; B. Hazelton Smith, Niles, Mich., 2 ckl, 5 pl, 1 young pen; Herbert S. Probert, Fort Dodge, Ia., 2 pl; James Livingstone, Milwaukee, Wis., 2 old pen.

A big showing of Buff Wyandottes. First cock a wonder. Elegant, soft buff top color, ideal spread and carriage of tail, and pure buff in tail. Second cock also clear in tail; of soft, rich color, but lacks fullness of 1st. First hen great type, sound level color, sound wings and tail, deep under color; rough in feather of cushion as it approaches tail. First cockerel had comb, type and evenness of color; a wonderful bird; clear in tail and wings; one tone of color richer than 1st cock, which was a model for this class.

Practically all of the pullets were one shade lighter in breast than any other section. The hen class shows that these birds go lighter and patchy as hens. Smoother colored pullets can only be produced by Buff Wyandotte men paying more attention to the breast color of their males. A male breast free from shaftiness and light edging on tips of feathers is necessary. When the Red breeders began to get males with good breasts, they began to get what they wanted in their females. The Buff Wyandotte breeders have wonderful tops on their males, the clearest of buff tails and the breast should come in for more attention.

White Wyandotte—L. J. Demberger, Stewartsville, Ind., 2-4 cock, 1-2-4 hen, 1 ckl, 2-3-4 pl, 2-3 old pen, 1-2 young pen; C. E. Smith, Lyons, Iowa, 5 cock, 3 hen, 4 old pen, 3 young pen; Halbersleben Bros., 1 cock, 1 old pen; Z. Fletcher & Son, Frankville, O., 3 cock; F. C. Beith, Wheatland, N. D., 5 hen, 5 ckl, 1-5 pl; Otto Newlin, Georgetown, Ill., 2-4 ckl; W. B. Meils, Streator, Ill., 3 ckl; Young's East Grove Farm, Downers Grove, Ill., 4 young pen.

A strong class of White Wyandottes. First cock, a bad comb. First hen rather heavy in fluff. First cockerel, a good bird, and deserving of the honor. Second cockerel, lacks breast. Several good cockerels left out. First pullet, a good looker, but has considerable black ticking on one secondary feather. Third pullet a green spot on her shank as big as a half dollar. Some of the little White Wyandottes.

HARRISON'S ALLIED BREEDS

The Exhibition Egg Strains

Eggs and Chicks from selected quality stock only. Prize winners at largest shows. Egg records up to 285 eggs. Many trapnested, linebred, pedigreed and registered birds.

THE ALLIED PLAN—The best known strains of the most popular breeds of reliable Lincoln Breeders are under our management. You are thus assured of the truest quality in Standard markings and the highest development in egg-laying at the lowest possible figure, with the protection of the strongest guarantee known among poultry breeders. In ordering eggs for hatching or baby chicks our "Security Bond" protects you from any loss in any way due to our part. Our "Poultry Breeding Bulletins," issued quarterly, give you necessary particulars in the care of eggs and baby chicks for the highest results. Sent free to customers. Yearly subscription, 25 cents. Sample copy on request.

—THE ALLIED BREEDS—

RHODE ISLAND REDS—Single and Rose Comb.

RHODE ISLAND WHITES—Single and Rose Comb.

LEGHORNS—White, Black and Buff (both Combs.)

WYANDOTTES—White and Buff.

ROCKS—Barred, White and Buff.

ORPINGTONS—White and Buff.

MINORCAS—Black and Buff.

ANCONAS—Single and Rose.

(Others to be included.)

Eggs and Chicks from Desired Breed and Variety

1. **Special Color Matings:** Show-winning quality males individually mated to "capacity tested" females of highest exhibition markings.

Combination Offer No. 4—Eggs and Chicks from above matings, all varieties. Fifteen Eggs, \$7.50; 30 Eggs, \$12.50; 100 Eggs, \$37.50. Chicks, \$1 each; 25 Chicks, \$20; 100 Chicks, \$75.

2. **Special Egg-Laying Matings:** Line-bred males of size, type and quality, from heaviest layers, mated to selected, line-bred "capacity tested" females of truest breeding.

Combination Offer No. 8—Eggs and Chicks from above matings, all varieties. Fifteen Eggs, \$5; 30 Eggs, \$7.50; 100 Eggs, \$22.50. Chicks, 65 cents each; 25 Chicks, \$12; 100 Chicks, \$45.

3. **Special Incubator Matings:** Specially selected and "capacity tested" females in farm range, mated with large-boned exhibition quality males.

Combination Offer No. 9: Eggs and Chicks from above matings in Reds, White Leghorns, White Wyandottes and Barred Rocks. Fifteen Eggs, \$3; 30 Eggs, \$5; 100 Eggs, \$15. Chicks, 40c each; 25 Chicks, \$8; 100 Chicks, \$30.

JANUARY SPECIALS

Shipments of 15 and 30 Eggs go parcel post until March 1. A part payment in advance secures desired delivery dates. Our Egg and Chick Catalog No. 9 gives prices and guarantees. We provide Complimentary Offers with each shipment. Our guarantees cover safe delivery, fertility and a "good hatch." Our "Poultry Breeding Bulletins" give instructions quarterly. Our "Security Bond" is published in each catalog. Get one. Address

dotte fellows who won well in this class, should not get chesty, but improve, improve, improve, or they will show one of these times and find that they are a flock of sheep led to the slaughter. Demberger is coming. He is the man to watch. He has just spent \$2,000 on his plant, putting it in shape for greater production; and he is sure to come back next year with a cockerel as good as his first, one as good as his unplaced cockerel, and a pullet as good as the one which stood alongside of his 3d prize pullet, which was only a filler, and unless you fellows are up and doing, he will sweep you clean.

Single Comb Reds—W. J. Rezac, Hibbing, Minn., 5 cock, 1 ckl, 4 old pen; Utley-Sturtevant, 2 cock; Red Cloud Poultry Farm, Cincinnati, O., 4 cock; O. L. Boehm, Fort Dodge, Ia., 3 cock, 1-2 hen, 5 ckl, 3 old pen, 5 young pen; Hurstbourne Farm, of St. Matthews, Ky., 1 cock, 1 pl, 2 old pen, 3-4 young pen; E. W. Mahood, Webster Groves, Mo., 3-4 hen, 4 ckl, 2-3 pl, 1 old pen, 1-2 young pen; J. D. Veach, 5 hen; Herman Seaver, 2 ckl, 4-5 pl; J. F. Craig, Danville, Ill., 3 ckl; Haynes & Snider, Swanton, O., 5 old pen.

Rose Comb Reds—Longfield Poultry Farm, Bluffton, Ind., 2-4 cock, 4-5 hen, 4-5 pl, 1 old pen; Haynes & Snider, 3 cock, 4 ckl; Hurstbourne Farm, 1-5 cock, 2 hen, 1-2 ckl, 1-2-3 pl, 3 old pen, 1-2 young pen; Scranton Red Farm, Scranton, Ia., 3 hen; J. D. Veach, Helena, Mont., 1 hen, 4 young pen; Busy Bee Poultry Farm, Rockford, Ill., 5 ckl; Harry E. Walters, Medapolis, Ia., 3 ckl; Glen R. Brown, St. Joseph, Mich., 2 old pen, 5 young pen; Frank A. Diggins, Harvard, Ill., 3 young pen.

First S. C. Red cock was a wonderfully fit bird. Although he had been shown at Kansas City the week before, he was in fine fettle, plump and as hard as nails. This cock had beautifully deep red color, and was free from striping in hackle. 1st, 2d, 3d, 4th and 5th S. C. hens were of a quality never put down in Chicago before, and we doubt if ever equaled before in any show in America. There has been more improvement in Rhode Island Red hens in the last five years than in the females of any other Standard variety. These 5 hens were of a rich, level, lustrous color all over, breasts included, and their color ran deep. When it comes down to details, the 1st hen had the best shape, and the 4th the smoothest texture of feather. All five were more or less generously ticked in hackle. The first hen had a little pepper.

In pullets the 2d S. C. pullet evidently had had a little pepper on wing bows, for there was some new plumage growing in this section; she had also had more or less black in her tail coverts. We mention this to emphasize that the Red breeders are bordering on the extreme in their effort to produce the depth of color required to win. We will add, however, that such a sound breast color and such depth of color as was possessed by the second pullet, we have never seen before. The first S. C. cockerel we mentioned in the introduction to this report. A large upstanding, long bodied bird. Coarse in comb. One shade of deep red, free from ticking in hackle, smooth plumage. There were forty other cockerels in the class. The winners had under color, they had rich colored primaries and secondaries, they had rich colored breasts. The second cockerel's hackle was a shade lighter than his back, and we thought his back too rough and mahogany; but in some instances surface color was sacrificed to under color.

The display of Rose Comb Reds was slightly smaller in numbers but about equal in quality to the Single Combs. The first R. C. Red cockerel was a bonehead play, being pretty generously covered with stubs. The first, second and third Rose Comb pullets were big, well grown pullets, of good shape, and rich, level color. There were some wonderful females in the pens of both varieties. The improvement in Red females and the increase in numbers of good ones is one of the most remarkable things in the history of purebred poultry in America. First Rose Comb hen was a particularly pleasing bird, about Standard size and very rich in color. This hen was entered from Montana, showing that breeders in the Northwest have some of the best. The Rose Comb should be the most popular variety in that climate.

Buckeye—Earl Thompson, Mason, Ohio, 1 cock, 1 hen, 1 ckl, 1 pl. First cockerel and first pullet were representative of the true Buckeye when it is bred in good quality. First cock did not have a short enough feather. First hen typical of a poor colored Buckeye female.

S. C. Rhode Island Whites—L. A. Holt, Stevensville, Mont., 1 cock, 2 ckl, 2 pl; J. H. Movius, Lidgerwood, N. D., 1-3 ckl, 1-3-4 pl, 1 young pen.

R. C. Rhode Island Whites—J. H. Movius, 1 cock, 1-2-3-5 hen, 2 ckl, 1-3 pl, 1 young

Pearl Grit Makes Hens Lay

INTENSIVE egg production is not a dream. Hens must have lime, carbohydrates and silicon to increase the eggs in number and quality. These essential shell and albumen forming elements are found in every grain of

Quit Worrying About Your Hatches Use the "SUCCESSFUL" Incubator

In all our 28 years of experience, we have never known of a time when a strictly first-class incubator meant more to you than the "Successful" does now. You are not experimenting when you get a "Successful" incubator.

20 Good Reasons As Outlined Below Why the "Successful" Should Do Your Hatching

100 to 112 Eggs Daily in Midwinter From 160 Hens

Bradford, Penn., Jan. 14th, 1920

Gentlemen:—Fireless, Non-Freezing Fountain came to hand promptly and with the "Successful." My hens are doing fine; have 160 and get from 100 to 112 eggs daily in this cold weather. Send all your printed matter to address mentioned below.

M. G. RAUB, 100 Main St.

20 Big Points

- 1—I personally guarantee that the "Successful" Incubators will hatch larger and stronger chicks and a larger percentage than any other incubator when operated under the same conditions.
- 2—My remarkably low price offers with high quality.
- 3—The only hatcher that heats the colder edges of the body first.
- 4—Round corners on tank, giving faster current, more heat, even regulation.
- 5—Heaviest copper tank used on any incubator.
- 6—Only one scientifically ventilated. Admits cold air at center of top. Does not create draft which dries out eggs.
- 7—Safety attachment on lamp burner—provides absolute protection from fire.
- 8—Only incubator with two glass doors—through which thermometer may be seen.
- 9—Combination water thermostat regulator.
- 10—The only machine guaranteed with a guaranty that guarantees and evades no issue.
- 11—Built like a refrigerator.
- 12—Case non-warpage.
- 13—Weights more.
- 14—Costs less per pound.
- 15—Strongest, most durable egg trays.
- 16—Nursery under egg trays. The greatest feature applied to artificial incubation.
- 17—Detachable legs, allowing machine to be stored in very small space.
- 18—The only incubator in the world cabinet made.
- 19—Simple, effective application of moisture when necessary.
- 20—Adjustable thermometer. Never necessary to open doors or pull out the trays to read temperature. Thermometer is stationary; chicks cannot knock it over.

RAISE more poultry—sell at high prices—make more good profits yourself. That's my argument to you this year, reader, and I am backing it up with a machine that has stood the test for 28 years and has helped to make many of the *biggest money makers* in the poultry business. I offer with it no premiums, no sensational claims, no fancy frills, nothing but a pure quality hatcher at the lowest price possible.

Write for Catalog—Mail the Coupon

and let me prove my offer with a money-back guarantee. Take two or three hatches at my risk. I'll let you be the judge. Write today.

"SUCCESSFUL" Incubators and Brooders

Read the 20 points of construction. Here is the only incubator in the world that's *really* cabinet made so far as I know. The only hatcher that heats around the colder edges of the body first. Guaranteed to vary not over a fraction of one degree throughout the entire hatch—because our patented lamp and wafer thermostat regulators are 99.9-10 per cent perfect. Center top ventilation prevents dead chicks in the shell. But write for catalog and read all about it.

Poultry Lessons FREE 20 lessons in all, the real, genuine down-to-brass-tacks facts that explain the way to make money with poultry—everything just as you want it. Free to everyone buying a "Successful" Incubator or Brooder.

Famous little booklet, "Proper Care and Feeding of Chicks, Ducks and Turkeys," sent for 10c. Big poultry catalog is FREE. Write for it today. We also have high-grade poultry—stocks and eggs of all the leading varieties—land and water fowls.

Saved Feed But Got Eggs

How One Poultry Raiser Made His Hens Shell Out Eggs All Winter
Regardless of Cold or Stormy Weather—Same Methods Can Be
Used by Any One in the Back Yard or On the Farm.

HOW would you like to get 76 to 83 eggs from every hundred hens?

Every poultry raiser must admit it is good business to produce plenty of eggs all this winter now that eggs are bringing from 70 cents to \$1.25 in different markets, and when one dozen eggs will buy from two to three bushels of grain. Surely it's a great opportunity to make money.

There were several thousand hens and pullets on the 100-acre, western ranch at the start of the world-war under the personal management of R. F. Palmer. He was known as one of the most practical and successful poultry raisers and egg producers in America.

Not satisfied with the number of eggs his hens produced in stormy, cold weather, although a vast amount of high priced feed was consumed, he found a method of making them produce more eggs on a much smaller feed bill.

In fact his "home style" methods, as he called them, resulted in such wonderful egg production that leading poultry raisers the country over wondered at his success. When first asked about it Mr. Palmer said, "I finally found just the right proportion of certain cheaper grains which when so mixed by myself or by local elevators, did the business. It was my methods of 'how and when' I fed my hens that really resulted in their wonderful winter laying and made possible saving so much feed money. By my method I never wasted a pound of feed. The hens gave me full value in eggs for every ounce."

After this wonderful success he became associated with one of the big International Egg Laying Contests. For over three years he personally fed and cared for pullets that broke all known records for winter and yearly egg production. Again it was proven possible to get big egg yields in cold, stormy weather.

From all points in America, men and

women wrote asking his advice and methods. So many letters arrived daily, he was forced to buy three or four typewriters and hire help to answer all his mail. Finally it became necessary to charge enough to cover the cost of writing each one a three to five page letter, besides sending complete information on just what to feed, when and how to feed, together with his full recipe for his "home style" method of getting plenty of winter eggs.

Now that egg prices are so high and going higher, Mr. Palmer is anxious to help thousands more in getting plenty of winter eggs. He says, "for the next ten days or so I am willing to give my secrets away to those who will use the information. In fact I will only charge a part of what it will cost me. Tell the readers of the American Poultry Journal that to every one who sends me only \$1.00 by check, bill or money order, I will personally reply giving full information as to how I always get big winter egg yields and save on feed. I will also send my famous 'home style' recipe that never fails. Tell them to use my methods and recipe 30 days, then if fully satisfied they can send me \$2.00 more, but if not fully satisfied they will owe me nothing and no argument.

"In a short time I expect to start advertising my methods and 'home style' recipe in a big way and shall then charge at least \$5.00 to \$10.00. Tell the readers to hurry and write me while they can get it at cost."

So there you are, Mr. or Mrs. Chicken Raiser. This is your chance to get as many winter eggs as Palmer, who has simply made hens shell out eggs in the coldest of weather. The \$1.00 it requires today is nothing compared with the saving on feed and increased number of eggs you are certain to obtain. If you want to write him, and you surely will, his address is R. F. Palmer, Dept. 114, Sunny Slope Station, Kansas City, Mo.—Adv.

pen; T. D. McAuliffe, Lyons, Ia., 4 hen, 1-3 ckl, 2-4 pl, 2 young pen; M. A. Bohy, Albia, Ia., 4 ckl, 5 pl; L. A. Holt, 5 ckl.

Rhode Island Whites were not cooped with the Reds. Both Single and Rose Comb R. I. Whites were shown. The Single Combs at one end of the aisle looked like a sales class of White Rocks. Later on we came into the aisle at the other end and it looked like we had run into a sales class of White Wyandottes. The only hope of this variety is in putting breed character into it. It is up to the breeders to produce as good color as the White Rock and White Wyandotte men have and then distinguish their fowls by establishing a very definite type. Their problem is a harder one than the breeders of Reds faced, for the red color was at once a distinguishing mark, whereas the R. I. White men have nothing to distinguish their fowls except the true type of the breed.

Light Brahmas—Frank P. Johnson, Indianapolis, Ind., 1-5 cock, 1-5 hen, 1-3 ckl, 3 pl, 1-3 old pen, 2-4 young pen; O. L. Putnam, Harvard, Ill., 2 cock, 2 hen, 2-5 pl, 2-4 old pen, 3-5 young pen. Lora Vandivier, Franklin, Ind., 4 cock, 4 pl; Oscar Grow, Waterloo, Ia., 3 cock, 3 hen, 4 ckl; Ernest T. Johns, Wyandotte, Mich., 4 hen; John Davis, Frankfort, Ind., 2-5 ckl, 1 pl, 1 young pen.

First cock, a typical clean colored Johnson cock. Not faulty anywhere. Hackle not fully in; therefore sound in color. Second cock, stronger colored. Not as good in comb as first. Big, open V-shaped stripe in back that does not run into undercolor. Hackle fully in and broken in color underneath, but as good as seen in the variety. This bird is about what is wanted in eastern shows.

First hen, slatey in body and fluff; slight ticking in back. Hackle not as clearly laced as we like. A big hen, good tail coverts, good type. Second hen, clean back color; shorter back than first. Big class of hens; all nicely marked in tail coverts.

Some Brahma cockerels immature. First was big; good head; clean striping as seen on surface of hackle but not sound underneath.

First pullet fails in front of hackle under beak. Hackle should be laced around. Standard picture is misleading for it shows not only white throat which is right, but white front of hackle, which is wrong. A Brahma's hackle should come around and button in front like a collar.

As a whole, the class was the best seen in Chicago since the club meet three years ago. Western breeders are producing sounder black markings than characterized western birds a few years ago. Some of them are still emphasizing white backs a trifle too much. Second cock had strength of color and it showed in soundness of hackle striping, while his back was open striped enough so that he would produce good pullets. More such birds are needed by western breeders.

Black Langshans—Monarch Poultry Yards, Marion, Ill., 3 cock, 3-5 hen, 5 ckl, 3-4 pl; George Cooke, Racine, Wis., 1-2 cock, 1-2-4 hen, 1-2-3-4 ckl, 1-2-5 pl, 1 old pen, 1-2 young pen.

Black Langshans not up to those years when M. S. Barker has shown. First cockerel had the longest legs. While a short-legged bird is no good, a Langshan should have body as well as legs. Second cockerel well balanced in body and legs. First hen and first pullet, good pair of females but need more tail.

S. C. Dark Brown Leghorn—Moraine Farms, Dayton, O., 4 cock, 2 hen, 3 ckl, 1 pl, 2 old pen, 1-5 young pen; Grove Hill Poultry Farm, Waltham, Mass., 1-3-5 cock, 1-2-5 ckl; H. V. Tormohlen, Portland, Ind., 2 cock, 1 hen, 4 ckl, 3 pl, 1 old pen, 2 young pen; D. L. Doig, Sixteen, Mont., 4 hen, 3 young pen; A. H. Emch, Toledo, O., 5 hen; H. F. Becker, Waterloo, Ont., Can., 3 hen, 5 pl; Rev. W. F. Rolf, Zumbro Falls, Minn., 4 pl; L. H. Larsh, Dayton, O., 2 pl, 4 young pen; W. G. Warnock, Geneseo, Ill., 3 old pen.

S. C. Light Brown Leghorn—W. W. Harrington, Newton, Mass., 2 cock, 1 pl; H. V. Tormohlen, 1-3 cock, 1-3 hen, 1-3 ckl, 2-4 pl, 1 old pen, 1 young pen; Grove Hill Poultry Yards, 2-4-5 hen, 5 pl; Will C. Does, Lostant, Ill., 2 ckl; D. L. Doig, 4 ckl, 3 old pen; W. G. Warnock, 5 ckl, 2 young pen; Bonny Castle Poultry Yards, Louisville, Ky., 3 pl, 4 young pen.

The greatest class of Brown Leghorns ever brought together in an American show room, nearly every prominent breeder in U. S. and Canada competing. Two hundred eighteen S. C. Browns shown. Wm. Ellery Bright of Grove Hill came west from Boston; loaded his birds in the baggage car of the Wolverine limited; had a truck meet the train at Chicago; spent the week at the show, keeping in touch with his Boston business by telegraph and long distance telephone. Bright has bred the Browns since 1876, yet had one

KEIPPER COLLAPSIBLE ALL WIRE COOP

Greatest coop that ever graced a show room. Indispensable to breeders and exhibitors for training and conditioning birds. Wonderful for rabbits. Shows cooped on a rental anywhere. Coops rented to shows with privilege of buying. We also manufacture shipping coops,

canary shelf and breeding cages, egg carriers, fountains, feed hoppers, etc. Where size permits goods are sent by Parcel Post prepaid. Besides our factory at MILWAUKEE we have warehouses at KANSAS CITY and PITTSBURG and will ship from nearest point. Send for catalogue to-day.

CAUTION:

Any Bone Cutter claimed to be MANN'S without F. W. MANN CO. cast on its surface, is an imitation. The genuine MANN'S is made only in Milford.

Make Your Hens Lay

You can double your egg yield by feeding fresh-cut, raw bone. It contains over four times as much egg-making material as grain and takes the place of bugs and worms in fowls' diet. That's why it gives more eggs, greater fertility, stronger chicks, larger fowls.

MANN'S LATEST MODEL BONE CUTTER

Cuts easily and rapidly all large and small bones with adhering meat and gristle. Automatically adapts to your strength. Never clogs. Sent on 10 Days' Free Trial. No money down. Send for our free books today. F. W. MANN CO. Box 56 MILFORD, MASS.

cockerel disqualified for a stub. Dudley Coakley has been poultryman for him for twenty-six years, and is now given charge of the Browns. We shall look for better saddles another year as a result of Coakley's matings. Bright has size, elegant heads, proper station, a very bright ground color of even shade and snappy, clean cut striping, but juncture of tail and back is too sharp. This is a fair criticism on his first cockerel. Females must be bred that have harder and longer feather in cushion, and longer and more numerous tail coverts. When A. C. Smith was superintendent for Bright, he had the backs on his males.

Tormohlen has what is needed in his fourth cockerel; tail coverts so numerous that they overlap; saddle rounding up onto tail. This cockerel has a pure white, round, velvety soft ear lobe. White at base of hackle and falls down to fourth prize. His head, back and tail alone are worth \$100 to any breeder.

Moraine Farms' exhibition cockerels are big but heavy in comb. Walter Young has grown Orpingtons, Reds and Sussex so long that he must have fed his Leghorns the same. Good Leghorn men should grow birds a little slower. Walter has beautiful color, striping and furnish of feather.

Some fascinating pulletbred females, Tormohlen being especially strong in both hens and pullets. Soft stippling, ground color free from gray, absence of shafting, practically no brick on wings.

Some of the dark females were too soft in feather for cockerel breeders that will produce the desired saddles and furnishings on tail.

Difference of opinion on pullet breeding males. Some say beautiful, others do not like them. They appeal to us. Look at the Black Red Game bantams—golden hackle, red wing bows and red back, light golden saddle. Whoever said a black breasted red Game was not beautiful? In England all Brown Leghorn males have an orange head, lemon hackle striped in lower feathers, orange wing bows and back, and saddles that end out lighter and free from striping. That is a light Brown Leghorn male as seen at Chicago. Keep these males coming and there will be plenty of takers.

R. C. Brown Leghorn, Dark—Ralph W. Strong, Kalamazoo, Mich., 2 cock, 1 hen, 1-2 ckl, 1 pl; Otto Chastain, Mitchell, Ind., 1-3 cock, 2 hen, 3 ckl; Wm. Chastain, Tunnelton, Ind., 2 pl.

R. C. Brown Leghorn, Light—Ralph W. Strong, 1 cock, 1-2 hen, 1 ckl, 5 pl; Otto Chastain, 2 ckl, 1 pl; Fred Alger, Waukau, Wis., 3 pl; H. F. Gifford, Cuyahoga Falls, O., 4 pl; Wm. Chastain, 2 pl.

Rose Comb Browns improving, and following the S. C. Brown progress. Brown Leghorns judged by Herman Rickoff who did conscientious work, meted out justice, and all exhibitors were pleased. The hardest classes in the show to judge and there were no complaints.

S. C. Buff Leghorn—Albert J. Hans, Des Plaines, Ill., 2 cock; Floyd Purdy, Tomah, Wis., 3 cock, 2 hen, 3 ckl, 1-2 pl, 1 young pen; Geo. W. Rex, Slatedale, Pa., 5 cock, 5 hen, 2 ckl, 2 young pen; Wm. E. Crevoiserat, Freeport, N. Y., 1 cock; A. Allen Oswald, Toledo, O., 4 cock, 4 pl; Herb D. Wilson, 3 hen; Geo. J. Gable, Toledo, O., 1 hen, 4-5 ckl; C. M. Herren, La Junta, Colo., 4 hen, 1 ckl, 3 pl; Geo. D. Bush, Elyria, O., 5 pl; Advance Poultry Yards, Elgin, Ill., 4 young pen; F. S. Smith, Hamilton, O., 5 young pen; F. Lehman, Butte, Mont., 3 young pen.

A wonderful class of Buff Leghorns. Golden buff males, clear in wing and tail, one shade of buff all over. Type is improving rapidly. Station is typically Leghorn, backs are good, tails are lower and better furnished. Combs on males are neat and of fine texture, lobes white and wattles nicely rounded. First cock level, soft color, good head, little more leg desirable. Bent down tail feathers put one entire line outside the ribbons in this variety, and we commend the discretion of the judge, Herman Rickoff. First hen, softest colored, best shaped Buff Leghorn hen ever seen at Chicago. A hen without a fault.

Glad to note such fine type, level soft color, good head in first cockerel. Second, elegant color, good type. Third, young. Fourth cockerel, equally as typical as first, but trifle lighter at base of hackle than on wing bows and back. First pullet, good color, but not a good comb for a pullet. Second pullet, fine color but sets a little low. A nicer class of Buff pullets has never been cooped in the west.

S. C. Black Leghorn—Milo L. Meyers, of Maryville, O., 1-2 cock, 1-2-3 hen, 2-4-5 ckl, 3-4 pl; H. C. Hunt, Delaware, O., 4-5 hen, 1-2 pl; J. M. Huber, Marysville, O., 1-3 ckl.

First cock, yellow shanks, good type, lustrous surface, sound under in hackle and saddle. First hen, good in type, plumage color and shank color. Other hens not as

Buttermilk Pure and Dried

"The Great Egg Maker"

Buttermilk, that wonderful egg producing and health giving food for poultry, is now available in dry form put up in paper lined bags of 10, 25, 50 and 100 lbs.

P. D. B. (Pure Dried Buttermilk) is fresh creamy buttermilk—right from the churn, with all the water removed by a process that retains all the valuable nutrients. All poultry experts give Dry Buttermilk their highest endorsement. It is 100% digestible and a wonderful egg producing and health giving feed.

Pure DRIED Buttermilk

added to your fowls daily ration of grain or mash, quickly demonstrates its value as an egg producer. Hens lay as they never laid before when fed P. D. B. The lactic acid in P. D. B. greatly assists digestion, and helps to keep the fowls in healthy condition, therefore more eggs.

A poultryman in Pennsylvania writes that in 21 years of experience in feeding for eggs he has never found anything that produces eggs as cheaply and keeps fowls in as healthy condition as Pure Dried Buttermilk. Right now when eggs are bringing high prices you owe it to yourself to get acquainted with P. D. B. It means more eggs, healthier birds, consequently more money for you.

Send for FREE SAMPLE

A free sample of Pure Dried Buttermilk is yours for the asking. Write today for sample and circular showing how P. D. B. will help you double your poultry profits.

An Egg a Day From Every Hen?

Can you do it? Does your experience lead you to believe it possible?

According to some advertising you can. Frankly, we never saw it done—haven't been able to do it at our own big farm.

But there is one thing dead sure—you can get a **GREAT MANY MORE EGGS FROM YOUR FLOCK EVERY DAY THE YEAR THROUGH** if you add

Pratts Poultry Regulator

to any good egg-making ration. This has been proven by hundreds of thousands of poultrymen during the last fifty years.

There is nothing mysterious about the action of this great egg tonic and poultry conditioner. It is *not* a food—it is a scientific combination of natural tonics and health-builders that puts hens in condition to lay—keeps them so—helps them to digest large quantities of feed and turn it into eggs.

With eggs at present prices you should not hesitate to try anything within reason that promises to increase production. Just try Pratts Poultry Regulator—try it now—try it *at our risk*.

Our money back guarantee protects you fully

Your local dealer can supply you with the **genuine** Pratts. Refuse substitutes.

PRATT FOOD CO. Philadelphia

Cow Tonic, Hog Tonic, Buttermilk Baby
Chick Food, Stock and Poultry Remedies.

P41

bright yellow in shanks; look like cockerel breeders rather than bred from a golden yellow shanked male. (Such males are usually cotton at base of hackle.) First cockerel, a good Leghorn. Second on same order but not as good in shank color. First pullet, mottled shanks like an Ancona and looks like a cockerel breeder.

S. C. Silver Leghorn—F. O. Dudgeon, Cleveland, O., 1 cock, 1 hen, 1 ckl, 1 pl; J. E. Davis, 2 hen; Maurice Titland, Mound City, S. D., 2 ckl, 2 pl.

Silver Leghorns are a true single mating variety. Males should be striped in lower hackle and white in back and saddle. Striped-back males produce coarse or penciled females, just as they do in Dark Brown Leghorns. Second cockerel striped like a Dark Brown Leghorn male. First cock and first cockerel, silvery white backs. First hen, the best we have seen; the fine stippling of a Silver Gray Dorking; steel gray color; beautiful salmon breast. A big hen; excellent egg capacity as indicated by a large, flexible abdomen. All the utility is not in the popular varieties, or coarse utility birds. Some of the little known varieties only wait for a good breeder to become interested in them.

S. C. White Leghorn—Hillview Farm, Benld, Ill., 2-3-4 cock, 1-4-5 hen, 2-3-4-5 ckl, 1-2-3 pl, 1-2 old pen, 1-4 young pen; John H. Gover, Denver, Colo., 1 cock, 5 young pen; Geo. B. Ferris, Grand Rapids, Mich., 5 cock, 2 hen, 3 old pen, 2 young pen; Frank D. Rogers, Elgin, Ill., 3 hen, 1 ckl, 4-5 pl, 4 old pen, 3 young pen; W. H. Sanders, Wheatridge, Colo., 5 old pen.

A wonderful entry of White Leghorns. No better are shown at any show in America. First cock a worthy bird. He had the top and bottom lines that you see in the pictures. Second cock, not so good in comb, same good Leghorn lines as first, and when you looked down on him he carried his width all the way back, his tail not being compact and running abruptly into a broad saddle. Third cock, fine head but lacks length of body, his wings projecting beyond fluff. Fourth cock, of good length but fails to second and third in elegant width of tail. Fifth cock shows some age.

First hen, a good Leghorn in every way. Second an uncommonly big bird for the exhibition class. This is in line with progress for the Leghorn weights will undoubtedly be raised ½ pound. Third hen, well balanced, very showy and of correct lines.

Everybody seemed glad to see Rogers win first cockerel. A top quality bird. Young, who judged, said a better one had not been shown at Chicago. Five point comb and fine texture. Young lays emphasis on back half of a Leghorn male, and first cockerel had a long saddle, not puffed or shown unnaturally; graceful, natural, low tail, long saddle hangers and tail coverts; soft, nicely rounded wattles. Second cockerel not as long in saddle. Correct in head, station, back and underline. Tail of correct angle; tail coverts, very broad feathers; coverts were numerous all the way out to sickles; and coverts and lesser sickles were broad and hard surfaced. Where saddle joins tail there were hangers an inch wide. Third, fourth and fifth cockerels, wonderful birds. Coops too small for such males.

First pullet, nice back and tail. Not as long in legs as some. Young says that there are four defects in length of legs; when shanks are long and thigh is short; when the shanks are short and thigh is long; when both are either too short or too long. He says that such as first pullet were always his best layers, which is in keeping with the preachments of utility men, and first pullet should take the wind out of their sails for a time. Second and third pullets, fine big pullets, good length and proportions. Fourth a little smaller; beats fifth in comb.

R. C. White Leghorn—Geo. Gerhard, Milwaukee, Wis., 1 cock, 5 hen; Geo. A. Rippler, Bensonsport, Ia., 1-2-3-4 hen, 1-2-3-4-5 ckl, 1-2-3 pl; Clifford E. Anderson, Mooresville, Ind., 4-5 pl.

Rose Comb White Leghorns show improvement in all respects.

S. C. Black Minorca—A. Didricksen, White-water, Wis., 1-3 cock, 4 hen, 4-5 ckl, 5 pl, 3 old pen; Chas. G. Pape, Fort Wayne, Ind., 2-4-5 cock, 1-2-3-5 hen, 1-2-3 ckl, 1-2-3-4 pl, 1-2-4 old pen, 1-2-3 young pen; C. E. Hunter, Omaha, Neb., 4 young pen; Henry W. Boges, 5 young pen.

R. C. Black Minorca—R. B. Cleaver, Milford, Ill., 2 cock; H. A. Keister, Bangor, Mich., 1 cock, 1-2 hen, 1 ckl, 1-2 pl.

S. C. White Minorca—Hamilton Egg Farm, Rochelle Park, N. J., 4 cock, 1-5 hen, 1 old pen; Thos. Brodgen, Rush Lake, Wis., 2 cock, 2 hen, 3 ckl, 1 pl; Jos. F. Reichert, St. Cloud, Minn., 5 cock, 4 hen; Mrs. Harry Meiselbach, Melrose Park, Ill., 1-3 cock, 3 hen, 1-2 ckl, 2-3 pl.

R. C. White Minorca—Thos. Brodgen, 1-2 cock, 3 hen, 2 ckl, 1 pl; Mrs. Harry Meiselbach, 1-2 hen, 1-3 ckl, 2-3 pl.

ANCONAS

Great Canadian Contest

Cold Canadian Winters

Highest Scoring Pen in all the Dominion Contests. The **Sole Product of GIES' Wonderful Strain of Anconas**. Proving they are the "WORLD'S BEST BY TEST," outlaying all other strains of Anconas, Rocks, Reds, Leghorns, etc. Now two years in succession they have made this sensational record.

We Verify Our Claims

Mr. Howe, Winnipeg, Manitoba, writes, our S. C. Ancona Pen at the official Government. Brandon, Manitoba, egg-laying contest have a lead of over 200 eggs over their nearest competitors, being the highest scoring pen in all the Dominion contests. I raise my hat to you, Mr. Gies, for having supplied me with such a wonderful pen of layers, and I may say here that all my flock of bred-to-lay Anconas are the sole product and breeding of Mr. Gies' wonderful strain of trap-nested Anconas.

We are headquarters for America's greatest egg-producing Anconas; they are also winning many blue ribbons for my customers at America's national shows. Mr. Chas. N. Schneider, Riverside, N. J., U. S. A., writes: Received Cockerel O. K., and wish to say I am entirely satisfied, as he is a dandy specimen, well worth the name "WORLD'S BEST." If there is anybody in my section would like to know of your stock I would be pleased to tell them of the quality and the square deal they will receive from you. Could fill a book of testimonials. May I quote you prices on single birds or breeding trios?

Moisture IS LIFE

Dry-Air Incubation is like the Heat of the Desert

In hot, *moist* countries, life is abundant. In hot, *dry* countries, the earth is almost barren and few animals are found.

Moisture is necessary to life—in *incubation*, as elsewhere. The successful combination of warmth and moisture for this purpose is the reason bigger hatches of stronger chicks are obtained by users of

The Porter **SOFT-HEAT** Incubator

Warmth and Moisture

The U. S. Government says the right amount of moisture in an incubator means better hatching and stronger, healthier chicks. The Porter **SOFT-HEAT** automatically supplies the necessary, life-giving moisture by a patented air moistener—never too much or too little. Nature's process is duplicated exactly and every good egg hatches.

Hatches More and Stronger Chicks

In Soft Heat the eggs are not dried out. They retain the elements needed for the chick's complete development. The result is perfect, sturdy chicks that develop more rapidly and **make you more money**. And instead of dead dry air, laden with poisonous gases, they breathe and thrive in pure, **moist** air from the moment they pierce the shells.

Tubeless, Gasless, Smokeless

No gas, smoke or bad odor ever is found in the Porter. Nothing but the purest moist air ever reaches the egg chamber through **SOFT-HEAT'S** automatic ventilation system. The Porter's patented full radiator plate eliminates the cumbersome, unsatisfactory tubes and pipes of other style incubators.

Center Heat—Automatic Controls

Steady, **soft** heat, just like the hen's; radiated from above, just as the hen supplies it; in a round egg chamber, just like the hen's nest, makes the Porter Tubeless a true mechanical hen. Every egg is heated evenly—and automatically—every second.

Makes Shells Brittle—No Suffocation

Dry-air incubation is a mild form of baking. It makes the shells hard, the inner membranes tough. Chicks can't pierce them. Suffocation results. The soft, **moist** heat of the Porter keeps shells brittle and inner membranes tender. Every chick that develops breaks through easily at the right time. **The Porter hatches no cripples.**

Soft Heat Saves 300%

One filling of the Porter's fuel tank—less than a gallon of oil—completes a hatch. Other incubators burn 4 to 5 gallons and the lamp must be filled daily. The **SOFT-HEAT** saves 300 per cent in money, time and labor.

Only Two Minutes' Care Daily

Eggs in the Porter can be turned semi-automatically in 2 or 3 minutes without removing or lifting tray. A child can operate the **SOFT-HEAT**. Hundreds of inexperienced users report hatches of 90 to 100 per cent perfect at their first trial.

109 Eggs 109 Chicks

was the record a **SOFT-HEAT** Incubator made for Mrs. C. A. Ash, Litchfield, Mich., the first time she used it. Roy Klavine, Geneseo, Ill., got 100 chicks from 100 eggs. Hundreds report 90% to 100% hatches and big profits. Mrs. K. Pfaffenberger, Gillette, Ark., an inexperienced operator, got \$225 or better from 8 hatches. You can equal these records and make easy money with the tubeless, automatic **SOFT-HEAT**.

Increase Your **POULTRY PROFITS**

Money, time and worry are wasted on chicks that die in the shell. There's no profit in puny "scrub" hatches. And eggs are too valuable now to be wasted on unreliable incubators. Get away from the old dead-heat system this year and **make money!** Let a **SOFT-HEAT** Incubator turn every good egg into a plump, perfect chick that will grow quickly into cash. Every Porter Incubator is backed by an Ironclad Guarantee of Satisfaction. **We Ship By PREPAID EXPRESS.**

FREE! Read Our Big Book on Soft Heat

Contains 64 pages, fully illustrated. Explains in detail how **Soft-Heat** Incubation will decrease your losses and increase your profits—how simple and certain it is—how it saves time, trouble and money. Gives testimony of thousands of delighted users who are having amazing successes with the **SOFT-HEAT**. Investigate this wonderful system—greatest incubator improvement ever made—before you buy. Send us your name **TODAY**—a card will do—for a **FREE** copy of the **SOFT-HEAT** BOOK.

If You Keep Hens CUT THIS OUT

1,000 Eggs In Every Hen—Four to Seven Eggs a Week per Hen Through Cold Winter Season. With Eggs at Dollar a Dozen, Means \$5.00 Profit per Hen in Next Six Months.

Amazing Poultry Secrets Revealed By

AMERICA'S FOREMOST POULTRY EXPERT

This is an offer no reader of this paper who keeps chickens can afford to ignore. We will tell you why.

Henry Trafford, Famous Poultry Expert and Breeder, for nearly eighteen years Editor of "Poultry Success," has developed a new and remarkable system of rearing, breeding and feeding chickens for heavy egg production that seems certain to revolutionize the poultry industry and give five eggs or more for every egg produced today. This plan or system is explained in Mr. Trafford's "1,000 Egg Hen" a free copy of which will be sent to any person who keeps six hens or more.

Poultry keepers, following Mr. Trafford's directions, learn how to start young pullets laying early; make old hens molt quickly and resume heavy laying during entire winter season. Most any hen will lay in spring when eggs are cheap. Mr. Trafford tells how hens lay four to seven eggs a week during coldest winter days when eggs sell at a dollar a dozen or more. His system shows how any breeder, with ordinary care, may get 1,000 eggs or more from nearly every hen in five years' time at a net profit of \$25.00.

There is big money to be made with chickens this winter by the man or woman who gets the eggs. The time to get the hens ready for heavy winter laying is now. Mr. Trafford's "1,000 Egg Hen" system tells how and arrangements have been made whereby any reader of this paper may receive one copy absolutely free by using the Coupon below. Send no money, but cut out the Coupon and mail it with your name and address to Henry Trafford, 860S Tyne Bldg., Binghamton, N. Y., and the story of the 1,000 Egg Hen will be sent you by return mail.

January, 1921.
American Poultry Journal,
Chicago, Ill.

FREE COUPON

This Coupon entitles holder, provided he keeps six hens or more, to one free copy of Mr. Trafford's "1,000 Egg Hen." Write name and address plainly and enclose in envelope with this coupon. Address Henry Trafford, 860S Tyne Bldg., Binghamton, N. Y.

White Minorcas were the best ever cooped in the west. As a class they had size, type and color. First S. C. White Minorca cock a fine, upstanding, big bird. First cockerel, excellent head, back and tail, and pretty fair leg for a white. First hen, one of the biggest, longest, rangest ever shown; had fine head, back, tail and legs.

S. C. Buff Minorca—Edw. F. Schmidt, of Hazelrigg, Ind., 1-2-3 cock, 1-2-3 hen, 1-2-3 ckl, 1-2-3 pl, 1-2 old pen, 1-2 young pen; Chas. I. Smith, Eaton, O., 4 cock, 4 hen, 4 pl.

This variety owes much to Edward Schmidt. He is getting them big and has clear buff wings and tails on his females and sound buff wings on his males. First and second hens as big as Black Minorcas and sound white lobes. Schmidt wants Standard weights for the Buffs raised to the Black Minorca level. He does not want people to inquire why Buff Minorcas have a lower weight, for he does not have to apologize for his birds. This is food for thought for White and R. C. Black Minorca men.

Schmidt says: "Give the same weights to all varieties of the same breed, the same as in Orpingtons, Rocks and Wyandottes?"

White Faced Black Spanish—Tyronne Poultry Farm, Fenton, Mich., 3 cock, 2 hen, 4-5 ckl, 2 pl; J. E. Friend, Batavia, O., 4 cock; Ray Herget, Batavia, O., 2 cock, 1 hen, 1 ckl, 1 pl; F. T. Walker, Blanchester, O., 1 cock, 3 hen; Clarence Hewes, Indianapolis, Ind., 4-5 hen, 2-3 ckl, 3 pl, 1 old pen.

More genuine breeders of Spanish showing in this class than have come together before in modern times. Clarence Hewes, son of Theo. Hewes, worked hard to bring out the entry. He likes the Spanish. Old hands warned him against them, but he has found them hardy, and the greatest layers of really big eggs that he ever owned. Clarence wants a white face, but not a face elongated to the point of freakishness. He wants the emphasis put not on length of face, but on smoothness and texture of face.

First cock, big, excellent plumage color, good type, and while longer in face than second, length was largely in lobes and bird did not have a dewlap. Fourth cock at disadvantage because of wrinkled face; had squint eyes and could scarcely see out of right eye. One hen with such a face, hardly able to see, not placed.

Hewes wants birds that have good size and plumage and that do not get coop tired holding up their faces. Such chickens are strong, not weak, and are in line of progress. The day for extreme development in varieties of poultry has passed.

Blue Andalusians—Voris Morrison, Ramsey, Ill., 2 cock, 2 hen, 4 ckl, 1 pl; M. R. Knox, Downers Grove, Ill., 1 cock, 1 hen, 3 ckl, 2 pl; Chas. H. Foster, Anamosa, Ia., 3 hen, 2 ckl, 4 pl; L. C. Taylor, Gibsonburg, O., 1 ckl, 3 pl; C. A. Greenfield, Butte, Mont., 5 ckl, 1 young pen.

Dick Oke judged the Blues and awards indicate value of level blue ground color rather than good lacing and merely patchy ground color. The class not as good as last year when Jennings and Dobe were showing.

S. C. Anconas—T. H. Holmes, River Forest, Ill., 5 cock, 1-5 hen, 1 old pen, 2 young pen; Fred Erck, Chicago, Ill., 3 cock; Frank C. Stiers, Lakewood, O., 1 cock, 2-4 hen, 1-3 ckl, 1-2-3 pl, 1-3 young pen; Fred J. Duve & Son, Coshocton, O., 4 cock, 3 hen; Geo. P. Grube, Springfield, O., 2 cock, 4-5 ckl; E. R. Post, Ontarioville, Ill., 2 ckl; W. J. Crick, Pittsburgh, Pa., 5 pl; W. V. Wellman, Helena, Mont., 4 pl; Otto Berger, Maywood, Ill., 4 young pen; C. E. Johnson, Ligonier, Pa., 5 young pen. R. C. Anconas—Lloyd Chezem, Helena, Mont., 1 ckl.

First Ancona cock shown in a young pen last year when he attracted favorable attention, comes back as an elegant cock; sound in color, elegant back and tail furnishings; neat 5-point comb, free from wrinkles, twists or marks. First hen of great type, long back feathers, coverts well out onto tail, hard surfaced plumage coated with a deep green sheen. Such tails and plumage on females are necessary to produce such well furnished cocks as first, and both first cock and hen are of same line of breeding. We counted only four black feathers, not tipped with white, in back of first hen. Not a black bird yet a sound colored hen because each white tip was very neat. Fourth hen also tipped in every feather, but looked light in color because feathers were too small. When feathers are big and greenish black, a small white tip at end of each feather gives desired effect.

A big class of pullets. Good condition of plumage, refinements in heads and legs. First, second and third pullets, good in wings and tails, black at base of hackle and on cape of back. Back proper, very attractive. Eighty percent of these back feathers tipped with neat white end. Better pullets were never shown. For a long time we have thought

KEELER'S VIGOROUS WHITE WYANDOTTES

The Aristocrats of the White Wyandotte World
Won Five Firsts Chicago—Six Firsts Indianapolis

For over a quarter of a century I have been furnishing winners for America's best shows—New York, Boston, Chicago, St. Louis, Kansas City, New Orleans, Los Angeles, etc. I am in a position to furnish you winners—birds that will win in any show room, also birds that will fill your egg baskets. My birds lay from 200 to 288 eggs a year, and begin to do it at six months of age or sooner. Quick maturity, show room quality and heavy laying makes KEELER'S WHITE WYANDOTTES IDEAL. Start right—Make your foundation Keeler's birds. You can build high on a sound foundation.

3000 Birds For Sale 3000 COCKS, HENS Cockerels and Pullets

Cocks and Cockerels, \$8, \$10, \$15, \$25, \$35 and \$50.
Hens and Pullets, \$5, \$8, \$10, \$15, \$25 and \$35.
Breeding Pens, male and four females, mated to produce winners and heavy layers, \$25, \$40, \$60, \$75 and \$100.
Special for January and February, 300 Strong, Vigorous Utility Cockerels, \$5 each.

My prices for stock and eggs the same before the war, during the war and after the war. Prices were not advanced during the war, so cannot be reduced now. Anybody can cut prices, but it takes brains to produce a better article. Please state wants plainly. Stock shipped on approval.

EGGS—EGGS—EGGS

The pens to produce the 1921-22 winners mated January 1. I am in a position to furnish you eggs from the 20 best matings of White Wyandottes in America for 1921. All of the very best birds reared the past three years are in these pens. My 1921 illustrated, instructive art catalog of America's finest White Wyandottes, describing these matings, is waiting for you, and your wisest act before buying stock or eggs for hatching is to send for my catalog.

QUALITY EGGS, \$5 per 15; \$9.50 per 30; \$14 per 50, and \$25 per 100. A limited number will be spared from the most special matings at \$8, \$10 and \$15 per 15.

1st Cockerel, Chicago.

Wyckoff's S. C. White Leghorns

AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain—unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that on recent investigation of 20 of the largest and most successful Leghorn egg farms in the United States, in every instance, it developed that the WYCKOFF LEGHORNS were their foundation. The most substantial proof of their exceptional quality.

EGGS FOR HATCHING

from the most carefully selected matings. Our breeding pens for 1921 are made up of the most carefully selected lot of stock in the country, barring none. Every egg furnished will be from a grand lot of special selected birds, representing our highest quality stock in every particular. For size, strength, vigor and laying qualities, together with the true Leghorn type, they are unequaled. Positively no second grade or immature birds mated, and no orders filled with eggs from "farmed-out" or other bought up junk. We are BREEDERS, not hucksters. Place your order for some of the eggs from this high grade stock, and get in line with the most profitable era ever known in the poultry business. Send for free catalog, giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country. Address

GREATER CHICAGO SHOW WINNINGS 1920

1-2 hens, 1 cockerel, 1-2-3-4-5 pullets, 1 old pen, 1-2-3 young pens, all specials and best display of the show

GLENN A. WILSON, Box 10, SANDWICH, ILL.

OTTO MODERN WHITE ORPINGTONS

Husky, heavy-boned Cockerels for pen-headers, from our winners at Indianapolis, Kansas City, Louisville, Cincinnati and Chicago Exhibition, and utility matings were made in December. Write for mating list.

WILLIAM N. OTTO 5019 Central Ave. INDIANAPOLIS, IND.

that one tipped feather in five did not describe the good ones, so we made a careful study of these good females, and found that they had a big, long feather which resulted in a large black surface to each feather, and then the feathers ended uniformly with a small, clear cut, white tip. About one feather in five in the good pullets was solid black; the first hen of the same line of breeding was tipped in nearly every feather. A pullet naturally gets lighter as a hen.

Ancona cockerels need improving. Rear end needs to be raised up which will result in better backs and tails. Such ticking in hackles and saddles of cockerels as Ratz showed at Chicago last year, or such type and color as Sheppard showed in cockerels at last Garden show, lacking in the cockerel class at Chicago this year.

Silver Campines—Frank E. Hering, South Bend, Ind., 1-2 cock, 1-2 hen, 1-2-5 ckl, 1-3-4 pl, 1 old pen, 1 young pen; Mrs. Lulu Carpenter, Greenup, Ill., 3 ckl, 2 young pen; W. E. Pakenham, Norwood, Ont., Can., 4 ckl, 2 pl.

For the ninth successive year Mr. Hering won Chicago. First and second cocks a team of good ones. Both second cock and first cockerel very large Campines. First and second hens about equal in quality and a pair of worthy matrons. Second cockerel, the color king of the class. Pullets attractive but somewhat younger. Second pullet especially good in breast and throat.

Golden Campines—C. G. Battles, Wellington, O., 1 cock, 1-2-3 ckl, 3-4 pl; Paul Zimmer, Waltham, Minn., 1 hen, 5 ckl, 2-5 pl; W. R. Hepfinger, Swanton, O., 4 ckl, 1 pl, 1 young pen.

A good class of Golden Campines is getting them better and better.

The variety always did have good size and type but well marked birds were not as widely distributed as at present.

S. S. Hamburg—J. Marten, 1 cock, 1-2 hen, 2 ckl; C. A. Greenfield, 1 ckl, 1-2 pl.

G. S. Hamburg—J. Marten, 1 cock, 1-2 hen, 1 ckl, 1-2 pl.

Not a big Hamburg entry, but birds cooped were attractive enough to lend pleasing variety to the big show. Strange the difference between the Silver and Golden Spangled. The tails of Silvers are white, each feather ending in a black spangle, this order is reversed in Golden and the tails are black.

Chantecler—Bro. Wilfrid, La Trappe, Quebec, Can., 1-2-3-4 cock, 1-2-3-4 hen, 1-2-3-4 ckl, 1-2-3-4 pl, 1 old pen, 1 young pen.

This is the second showing of Chanteclers at Chicago. The committee on new varieties which was appointed at the request of Secretary Hewes, considered that the Chanteclers have a distinctive type, but there was some question as to whether they have been bred in sufficient numbers to warrant their admission to the Standard.

Lakenvelder—Arthur F. Dau, Chicago, Ill., 1-2-3 hen, 1 ckl; Diamond O Stock Farm, Tinley Park, Ill., 1 young pen.

First hen as big as a Leghorn, which is a size unusual in Lakenvelders. First cockerel, good type and color; sound black head and neck, white back, black tail and saddle. One of the best ever shown.

Russian Orloffs—Geo. P. Grube, 2 ckl, 2 pl; Dr. M. A. Hansen, Osage, Ia., 1 ckl, 1 pl.

First pullet the top of this class. The richest, most even colored Orloff pullet ever seen in this country. Second pullet, a waster. First cockerel, younger than second, and wins on beard and mufing.

Faverolle—L. E. Tyler, Brockton, Mass., 1-2 ckl, 1-2 pl.

First and second pullets, big, heavy beards, true type, good wheaten color. Best pair ever seen in the west. First, second cockerels, big, good type, nice markings.

Houdan—Jos. A. Bass, Minneapolis, Minn., 1 cock, 1-2 hen, 1 ckl, 1-2 pl.

First Houdan cock on dark order, good type and feet, shy on beard. First, second hens, a pair of good Houdans.

S. C. Buff Orpington—Geo. E. Greenwood, Lake Mills, Wis., 5 cock, 2 ckl; C. S. Byers, Hazelrigg, Ind., 2-3 cock, 2-3 hen, 1-3-5 ckl, 4 pl, 1-3-4 old pen, 1-3-4 young pen; Mayslake Farm, Hinsdale, Ill., 1-4 cock, 1 hen, 4 ckl, 1-2 pl, 2 old pen, 2 young pen; Leo Anderson, Juaniata, Neb., 4 hen; E. M. Long, Osceola, Ind., 5 hen; Morris Poultry Farm, Lebanon, O., 5 pl; Wyant Bros., of Thorntown, Ind., 3 pl, 5 old pen, 5 young pen.

There have been some good Orpington shows in Chicago in the past, but nothing ever like the classes put down in the Coliseum, December, 1920. There were enough Buff Orpingtons in the pens to have filled the single classes. The birds that were entered in the singles were magnificent. First, second, third cocks were a trio of masterpieces; big, deep, broad, level shade of color, no high lights, golden buff.

First hen ahead of the class, soft tone of color, same shade all over. First cockerel, a show in himself; a bird to study, appreciate and remember. Just as there are a few "best" birds in every breeder's yards, so there are a few best birds in every show. Rarely have we seen the equal of this cockerel for set-up and finish. First pullet, smooth color, a trifle shorter in body than second which was of correct type and will make a massive hen. Conway of Mayslake Farm wins three firsts in the singles, a remarkable record for one year's work since his return from France.

There never was such competition in pens or so many good pens cooped in the Coliseum. Here was level color and uniformity throughout each five birds. Perhaps the public does not always appreciate the meaning of a pen prize, but breeders understand. A pen does not mean merely five good individuals, but four good females that are as alike as four sparrows sitting on a telephone wire, headed by a male that matches. Only men who have a real strain and study their matings can match a pen to win in such a show as this.

White Orpingtons—Morris Poultry Farm, 1-2-3-5 cock, 1-2-5 hen, 1-2-3-5 ckl, 1-2-4 pl, 1-3-4 old pen, 1-2 young pen; S. B. Brennan, Berwyn, Ill., 4 cock, 4 ckl; H. F. Kendall, Virginia, Minn., 3-4 hen, 3-5 pl, 2-5 old pen, 3-4 young pen.

First and second White Orpington cocks, big birds, broad all the way back, deep in front, thick through, yet active looking. Third smaller.

First hen, smooth feather, well put down; as wide through body at wing points as at wing bows; nothing coarse. Second, big hen; drift is toward cleaner lines than seen in second hen.

First and second cockerel, two good ones. When we saw them there was a little piece of Hamburg steak between the wires and Harold Rawnsley was slipping some leaves of cabbage into them. A lot of fellows are great feeders before judging, but Harold feeds a few tid-bits all the way through the show. Although an hour before, we saw him in the hotel and he complained that he was not feeling well, he was down at the show looking after those birds with the interest and affection that a race track man takes in his horse. Winning isn't luck with Harold; it is the result of devotion to his birds.

Black Orpington—C. S. Byers, 1-3-4 cock, 1-4-5 hen, 1-2-3-4 ckl, 1-2-5 pl, 1 old pen, 1 young pen. F. A. Grace, Helena, Mont., 2 cock, 3 hen, 5 ckl, 3-4 pl, 2 old pen, 2 young pen; J. Alfred Hanna, Grand Rapids, Mich., 5 cock; Wm. A. Frey, Sheboygan, Wis., 2 hen.

A modification in Black Orpington type is apparent. The pullet that went down to third was heavy in fluff and will make a creeper of a hen. First and 2d pullets were typical Orpingtons, yet not excessive in any way.

First cock, a big, broad, deep cock of good color and fine head.

First hen an example of the possibilities in this variety: a big individual with as big an abdomen as we ever measured, comparatively thin pelvic bones; very smooth face, free from wrinkles or coarseness; no Cochins type. Second hen, heavy in head gear and fluff.

First cockerel, typical Orpington in every way, broad all the way back. Second, little longer in shank.

Blue Orpington—Robert Meulen, Indianapolis, Ind., 1 cock, 1-2 hen.

First cock, nothing. First hen, fair color, good type.

Speckled Sussex—Moraine Farm, 1-2 cock, 1-2-4 hen, 1-2-3-5 ckl, 1-2-3 pl, 1-2 old pen, 1-2 young pen; J. DeVer Rogers & Son, Oxford, N. Y., 4 cock, 3-5 hen; A. & E. Tarbox, Yorkville, Ill., 4 ckl, 5 pl, 3 young pen; H. L. Bedford, Bailey, Tenn., 4 pl.

First cock, best we ever handled. Red ground color in saddle, black strip confined to tip end, nearly every feather nicely tipped with a neat white end. Excellent tri-colored breast, red, black and white evenly and properly distributed.

First hen, a tribute to Walter Young, who bred her. She stands at the head of the class, in the forefront of the variety. Such a hen does not grow on a gooseberry bush or come by chance. She represents thought applied to poultry breeding. An ideal shaped hen, big, long in back and body, great head, clean, rich ground color and every feather marked. Not dark because black bar is narrow, not light because white tip is small; bright in tone because ground color is rich and each individual feather is big enough to show a generous amount of this soft red ground color.

First, second and third pullets show the same kind of breeding. To produce these grand females, Walter lays emphasis on the breasts of his males, not on under color.

Dark Cornish—Dr. Howard H. Reid, Barre, Vt., 4 cock; James A. Thurston, Vancouver,

Dr. LeGear Says:

"Get More Winter Eggs"

Official Chart showing rise and fall of egg prices

Winter feeding and living conditions are unnatural for hens. They are deprived of the nutrient elements and laxative qualities of summer green feed, yet must absorb into the system more carbohydrates (starch and sugar) to withstand cold weather. If this is not provided, the egg yield is greatly reduced.

Dr. LeGear's Poultry Prescription combats these conditions successfully because it contains the necessary ingredients, scientifically compounded to aid digestion—tones up the system, sharpens the appetite and stimulates the egg producing organs. Result—more eggs. Read this record:

"From a small flock of hens I now get twenty to twenty-five eggs a day whereas before giving them Dr. LeGear's Poultry Prescription I only re-

ceived three or four eggs a day. The cost of the prescription has been repaid to me over and over." Mrs. J. W. Montgomery, Tunnel Hill, Ga.

DR. HESS POULTRY PAN-A-CE-A

Mating Time Is Here

Dr. Hess Poultry Pan-a-ce-a puts the breeders in fine condition, so that you get strong, livable chicks—chicks with power of resistance, chicks that will not fall a prey to every little chick ailment.

Speed Up Egg Production this spring with Dr. Hess Poultry Pan-a-ce-a. It contains tonics that promote a hen's digestion, tonics that tone up the dormant egg organs, so that the proper amount of food goes to egg production, and not all to flesh, fat and laziness. Always buy Pan-a-ce-a according to the size of your flock. Your dealer has a package to suit. Results guaranteed.

Packages from 30c to the 100 lb. drum. \$10.00
Except in the far West and Canada.

DR. HESS & CLARK Ashland, Ohio

B. C. Can., 2 cock, 5 hen, 4 young pen; Dr. J. Leslie Davis, Philadelphia, Pa., 3-5 cock, 1 hen, 1-2 ckl, 1 pl., 1-5 old pen, 1-5 young pen; G. R. White, Eaton, O., 1 cock; Frank H. Clement, Hempstead, N. Y., 3-4 hen, 2 old pen; Floyd P. Schuyler, Savanna, Ill., 2 hen, 4 old pen; Ernest B. Stanley, No. Bennington, Vt., 4-5 ckl; J. I. Lewis, Broken Arrow, Okla., 3 ckl, 3 pl, 3 young pen; S. T. Avent, Toronto, Ont., Can., 4 pl; J. D. Hutchisson, Oxford, O., 5 pl; R. E. Theinhardt, Helena, Mont., 2 pl; Dartmoor Yards, Oconomowoc, Wis., 3 old pen; Thos. Broad, Vancouver, Can., 2 young pen.

Old hands agreed that it was the greatest show of Dark Cornish ever cooped. We stood in front of an unplaced pen, and if, a few years back, those four hens had been cooped singly, they would have won 1-2-3-4 in any average show, and the first one would have been commented on as a good Cornish female.

Hens in first old pen were very large, size being a feature. There were no long legged males in the cock class. The winning cocks were dark. Second cock won color special with some lacing on wing bow. First, second and third cocks big, broad, wide set on very heavy legs. Second enormous proportions, very broad across shoulders, standing very wide on legs, heavy bone. First cock, better whipped tail, shorter in saddle, very typical and winner of shape special. Such deep metallic colored birds, however, will produce somewhat fewer nicely laced females.

Some hens carried medium light ground color, but every one was good in bone, with well spread, stocky legs, broad chest and shoulders. No narrow, long hens, but some better than others, especially in color, which must necessarily be second to type in this breed. The Cornish men are breeding quality throughout all their birds, old and young, both sexes, and no variety in the show was more uniformly good. A few hens were too long and soft in lower back plumage, near tail. Short, tight, hard saddles in males cannot be produced from soft backed females.

First hen, an Azel in type; a regular chunk. Second hen, not so coarse in head as first, more attractive ground color, tail in better condition, and as wide a hen as ever put down in an American show room.

In cockerels, some had too much tail and leg, but nothing like the extremes commonly met with. First and second cockerels, well built, big bodied, broad at shoulder, good backs and tails, but heavy and loose in combs.

First pullet, best of type. Second, little longer head, not as heavy in bone, but one shade of rich ground color, cleanly and beautifully penciled.

White Laced Red Cornish—Dr. R. B. Munn, Hampshire, Ill., 1 cock, 1-2 hen, 1-2 ckl, 1-2 pl, 1 old pen.

First cock had type and good breast lacing; good Cornish tail and short back feathers. First hen, attractive, rich ground color and nicely laced; white hackle; good type.

First pullet, fair. Second pullet, best type and color. Cockerels unattractive and poor.

Buff Cornish—J. W. Bloom, Altoona, Pa., 2 cock, 2 hen, 1 ckl, 3 pl; V. W. Jones, Essex, Ont., Can., 1 cock, 1 hen, 3 ckl, 2 pl, 1 young pen; C. Y. Gibbs, Yazata, Minn., 2-4 ckl, 1-4 pl.

Too much saddle on males and excess of fluff and back plumage on females.

White Cornish—C. Y. Gibbs, 2 cock, 1 pl; Mrs. L. D. Singley, Jackson, Ga., 4 cock, 4 hen, 1 old pen; Dr. F. H. Howland, Worcester, Mass., 1 cock, 2 hen, 3-4 pl; Andrew O. Olson, Jamestown, N. Y., 3 cock, 1 ckl, 2 pl; F. Bates Wilson, Jamestown, N. Y., 1-3 hen.

First cock, a good one, broad in back, heavy bone in shank; good head; not a bad tail for a White. First hen, too long in back, tail and legs. Second hen, a good one. First pullet, about the most reach in the class and young at that. For a Cornish man to put such a pullet over fourth is ridiculous. We understand that second hen and fourth pullet arrived in bad shape, one bird in coop having been smothered by express company, which may account for these two birds not showing up well and not landing higher.

Turkeys, Waterfowls and Bantams—Not as large a variety of turkeys as last year. First Bronze cock, outstanding; a bird whose bronze was like fire. Great class of Toulouse geese. No better anywhere in America; deep keels; big fowls.

Buff Cochins and Golden Sebright bantams only fair. First White Cochins bantam hen, cockerel and pullet; first Black Braasted Red Game bantam cock and hen, good specimens. First Black red cock, an outstanding chicken; had reach, whipped tail, short feather and class generally.

Brood Your Chicks with a Hen

Nature-Plus has solved the brooding problem for 50,000 poultry raisers in the United States and foreign countries, and is fully capable of solving yours. G. F. Kiessel, N. Champa St., Boone, Iowa, says: "I would not surrender the right to make and use Nature-Plus for \$500." H. A. Gray, Route 2, Fennville, Mich., writes: "It is far more successful than any artificially heated brooder I have ever seen." The Nature-Plus Hover is a practical combination of your hen and our hover. It will enable your hen to brood 150 to 200 chicks as safely as she could brood a dozen without the hover. No artificial heat, no danger, no expense. Patented in United States and foreign countries. Easily made with simple tools. Plans and rights sold to users under money-back guarantee. For further information, address,

Now is the Time!

To Make More Money From Your Poultry RIGHT NOW—Today—Is the Time to Get More Eggs—More Profits From Every Hen!

Make every hen in your flock pay. It is easy and simple—and sure—if you know how.

Never was there such opportunity for huge profits from poultry as *right now*. Eggs are selling high and going higher. Feed is going lower. *Everything is dropping in price but eggs*. Why not get your share of the big profits? I will tell you how—just as I have told thousands of other poultry raisers all over the United States and Canada. In fact, I guarantee success for you. I will show you

"I can make your flock pay big profits all the year 'round—I positively guarantee it!"

Hundreds of Money-Making Secrets and Practical Methods!

You take no chances. Why waste time, money and profits—guessing and experimenting? My methods are tested and have proven successful time and time again for over twenty-five thousand poultry raisers, both large and small, all over America and in seventeen foreign countries.

I will make you a successful poultry raiser and tell you how to get more eggs with less feed. I'll guarantee to do it—and quickly. Just send your name and address today for Free Book and learn how.
T. E. Quisenberry.

My Absolute Money-back Guarantee

I tell you at once all that you ever need to know to make a complete success with poultry. There is no guessing about it. What is more—I guarantee it or every penny of your money back and no argument about it.

Send No Money

I want to prove this is your big opportunity. To show you that I am in dead earnest I will send you *absolutely free* my new 80-page book on poultry raising. It tells how you can make money from the very start. This big Free Book is worth real money to any man or woman who raises chickens or ever expects to. Yet I offer it FREE to any reader of the American Poultry Journal who will write me at once. These books are limited, but there is one for you if you hurry.

I Made over \$2,000⁰⁰ With My Hens

In 12 Months' Time

—Says Mrs. H. A. Hume

**Read
Her
Letter**

\$2,000 On Eggs Alone!

Just extra money for Mrs. Hume, who started to raise chickens and sell eggs only as a side line.

Thousands who have followed the advice of T. E. Quisenberry in Poultry Raising have earned as much or more than Mrs. Hume. Whether on a large scale or with small flocks, they have made big money from their poultry. Read here what they have to say:

Make Over \$1,000 On 200 Hens

"By following your simple advice I sold, from 200 hens and pullets, \$1,288.58 worth of eggs, baby chicks, broilers, cockerels and pullets in exactly seven months. My feed bill was \$246.89. The eggs alone amounted to \$490.92, besides 276 dozen I set in the incubator. My success is entirely due to you. I would not part with the information you furnished me at any price."—Mrs. Chas. Rooks, Ohio.

You Can Do As Well

Whether you have a general farm or a back-yard flock, whether you are an experienced poultry raiser or just starting, you can make big profits this year with the practical knowledge that we offer you.

BIG FREE BOOK Act Quick And Now!

American Poultry School
Desk No. 2063
Kansas City,
Mo.

MR. T. E. QUISENBERRY,
President American Poultry School,
Kansas City, Missouri.

DEAR MR. QUISENBERRY:

I did over \$2,000.00 egg business last year. I surely have been successful with poultry since becoming a student of your school. Three years ago I knew absolutely nothing about culling, feeding for egg production, fertile eggs, or housing. Now I am confident I am capable of handling a flock of any size I care to, and do it successfully.

White Leghorns are no longer a side line with us. They are one of the main issues, as we realize more clear profit from our Leghorns than from any one grain crop, or the live stock, raised on our 400-acre farm.

Yours very truly,
Mrs. H. A. HUME.

Over \$5.00 Per Hen Net Profit

I thought you would be interested in the record of my flock of 210 hens the past 12 months while using your methods.

Eggs sold (2,686½ dozen).....	\$1,149.19
Chickens sold	217.38
Chickens used at home (70).....	35.00
Increase in flock (138 pullets).....	207.00

Total income	\$1,608.57
Cost of feed, etc.....	606.72

Net profit

There was no record kept of value of eggs used at home.—H. M. Luttrell, Ky.

Feeding Methods--Big Egg Yield

"As a result of the feeding methods you worked out for me, I am surely getting results; in fact, from pens today (October 23, 1920), containing 600 pullets, I received 345 eggs. Very often they run more. One pen of 100 ran 73 percent today, and one around 65 percent for the entire month. Really I am making money before I expected."—William Shands, Missouri.

American Poultry School, Kansas City, Mo.
Desk No. 2063.

Without any obligation upon my part, please send me Free of Charge a copy of your Big Illustrated 80 page Book. It will tell you "How to Get More Eggs and Save Feed" and how to double your profits.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

The third annual Mid-West Horticultural Exposition, held at Council Bluffs, Iowa, under the auspices of the Iowa Horticultural Society and the Council Bluffs Chamber of Commerce was the best of its kind ever held in the mid-west. The apple and vegetable and floral display was exceedingly large, six states competing for the valuable prizes and the honors of the winners. There is much credit due Earl Ferris, general manager; Prof. R. S. Herrick, secretary of the Horticultural Association; and Prof. S. A. Beach, president of the association. It cost \$22,000 to stage this show. More than \$8,000 was offered in cash prizes, besides fourteen trophies valued at \$1,000 each. The state allows the horticultural society the small sum of \$8,000 a year. A committee consisting of Hon. W. P. Dawson, A. Lake, Frank C. Pellett and B. Wilcox was appointed to go before the legislature and ask for an annual appropriation of \$25,000.

* * *

Will you please advise me where I can buy Burbank's hybrid berry Phenomenal and the Everbearing raspberry, as I want to plant some of them in the spring.
Ohio.

Alfin Stinchfield.

You can get these plants at any of the California nurseries. Why plant the first named novelty in Ohio? It is

not of value there. And the "everbearing" black raspberry is a myth.

* * *
We have 120 acres in Barry county, Missouri, mostly in timber. This is about 45 miles, southwest of Springfield. Approximately ten acres is cleared and in corn this year. This place lies three-quarters of a mile north and south. The north forty acres has a large drawing running from east to west, about the center of it. There is about fifteen or twenty acres on the south side of this that would lay to the north or have a north slope. We wish to put this in fruit in the spring; want to put out about 500 each of Jonathan, Grimes Golden, and perhaps two or three trees of a few other varieties, for our own use. Wish to put out 500 pear trees and the same number of peach trees. Do not know what are the best varieties of these. My father thinks it would be better for us to go to the nursery and get as large trees as we could, say, from three to five year old trees. What do you think of that plan?

Of course on this place there is about an equal amount of south slope. Would this be suitable for grapes and the different berries such as strawberries and black berries?

The balance of this tract is mostly smooth land, a red clay soil, loose and deep, with no solid rock in that part.

We have about 100 Cook strain White Orpingtons, 200 Byers strain Buff Orpingtons, and a few of Schmidt's strain of Buff Minorcas, each of these being from the best stock of the respective breeders. We are going to have three different locations. Do you think it would be better to raise one breed or continue with the three breeds.

We were raised in Iowa and believe we know what real farming is, but we are not posted on the fruit line as we should be, so come to you for information, as two of us

against losses of unhatchable eggs costs but \$2.50 for all time to come!! Think of the saving, besides

relief from worry and puny chicks. The Magic Egg Tester ("The most talked of poultry appliance in the world") turns the trick before incubation. \$2.50 each, insured parcel post. One year's trial, cost refunded if desired. Free circular.

Magic Egg Tester Works. Dept. B, Buffalo, N. Y., also Bridgeburg, Canada

take American Poultry Journal and have been much interested in your writings.

Please give me the address of a good fruit paper, also of a bee paper, as I believe these lines should go together; don't you? Of course we are not going to do all of this in thirty days; but give us three years, and if you come down in this country we will try to show you something as well as give you the best treatment possible. Please give us the information possible. J. H. Gibbs, Kansas.

You certainly are doing the right thing to plant your commercial apple orchard to Jonathan and Grimes Golden. You ought to, by all means, put in some Golden Delicious and Delicious. I think Golden Delicious the most valuable of all yellow apples. Plant two trees for home use of Duchess, Wealthy and Henry Clay.

Would plant Kieffer, Lincoln and Seckel pears.

You will find a peach orchard planted to Stark's Early Elberta, J. H. Hale and Krummel very profitable. Yes, the south slope would be all right for grapes. Such a slope is not, as a rule, best for strawberries, raspberries, etc.

You will make a great and costly mistake if you set out three and four-year-old apple or peach or pear trees. Such trees will never be right. The best orchard tree obtainable is a properly grown two-year-old tree. Please do not make the fatal mistake of setting out older trees.

I think it would be far better for you to keep but one breed of Standardbred poultry.

American Fruit Grower, State-Lake Building, Chicago.

Gleanings in Bee Culture, Medina, O.

Let me suggest that you should plant some Surprise, Wyant, Terry and De Sota plums. Also some Montmorency cherry; also some Oregon Champion gooseberry and Red Cross and Fay currants. Currants and gooseberries are very profitable. Mine net me \$600 an acre year in and year out. Yes, fruit, bees and poultry make a good combination. Thank you, I would like to drop down upon you some day.

* * *

I have eight acres in the heart of a mining community, fairly well settled. Do you think it would be profitable for me to plant an acre or two to grapes for canning and table use? The ground I can devote to grapes is rather flat and poorly drained. Would they grow on it, or should the ground be high and hilly? Can you give me any information about how to plant, prune and spray them? For this locality, what are the best market grapes in the purple and white varieties? Would it be advisable to dynamite the holes, and should the ground be tilled for drainage? Do you think it advisable to plant corn in a young, small orchard in order to secure cultivation for the trees? K. A. Sheffler, Indiana.

It would be unwise to plant grape vines in flat, poorly drained land. The grapevine demands that it be allowed to keep its feet dry. If you can properly drain this land it will be all right to plant it to grapes, although the grape, as well as other fruits, thrives best on elevated ground, where there is air drainage. This tract of land is more suited to gooseberries and currants than it is to grapes. The Concord is the best market grape. The Niagara is the best white grape. The grape in most commercial orchards is planted 8 by 8 feet. Plant one or two-year-old vines, cutting each vine to two buds when planting. The best grape growers spray the vines with arsenate of lead, Ford's mixture and Black Leaf 40. How to prune a bearing grapevine depends wholly on the system one adopts. Secure a copy of the "Pruning Book,"

Would you like to increase your egg records? A. G., Lakewood, Ohio, writes: "Please quote me prices on pullets. The ten pullets purchased from you last year laid 1,700 eggs in ten months." This party never kept poultry before. Get our catalog. It tells how to raise Anconas and feed for egg production. It's free. Stamps appreciated. **BAKER'S ANCONA FARM, Box A, Route 3, Elyria, Ohio.**

study the different vineyard systems. I would not use dynamite in planting grapevines. Yes, corn is a good crop in a young orchard.

* * *

Recently I have purchased a farm here in Vineland, N. J., and I want to plant about fifty peach trees and a few apple trees and grapevines for the home table. Will you kindly give me some advice as to what varieties to plant?
Joseph Faakel.

New Jersey.

Advise you to plant Duchess, Wealthy, Stayman and Golden Delicious apple trees. You will secure an early-to-late supply of peaches by planting the Rochester, Alton, Early Elberta, Elberta and J. H. Hale. The Moore's Early, Worden, Diamond, Niagara and Concord grapes will give you best returns.

* * *

I contemplate purchasing ten acres of land in Louisiana, part of it in timber, and intend to convert three or four acres of it to commercial poultry raising. I wish to plant the rest to pecans, fruit, and shall establish an apiary. This land will be in Webster parish, about five miles out of Minden, La., near Dorcheat bayou. What kind of fruit would you advise planting, also what kind of pecan trees, and what bee would be adapted to this locality? Do you think a small farm on the plan outlined would be a paying proposition there. Shreveport, La. (30 miles), is one market, and Dallas (300 miles) is another; New Orleans (250 miles) is still another, as also is Minden.

I intend to stock mainly with S. C. White Leghorns, as I understand they are standard stock with commercial egg farms, and perhaps stock some R. C. Rhode Island Reds. I am a young married man, no children, and have followed office work for the last seven years. My health is not what it should be, and I am trying my best to get into some line where I will be away from an office and have outdoor work.

Land may be purchased very reasonably, and for this reason my changes of getting a start in Louisiana are better from a financial standpoint than almost anywhere I know of. As my capital is limited, I would like your advice in regard to the whole thing before I make any definite plans, so I will not lose what I now have.
W. P. Sugg.
Texas.

The planting of an orchard in the section of Louisiana to which you refer would require a careful study of local conditions—character of soil, depth of water, table, air drainage and several other important considerations. I advise you to secure the services of one of the staff of horticulturists at the Louisiana State Horticultural College. I could advise you in a general way, but that would be of no service to you. You cannot afford to make a mistake in your planting.

* * *

We desire to find a location suitable for general farming in a small way, say, forty to eighty acres, in connection with poultry. We notice in looking over back numbers of American Poultry Journal that you speak highly of Loudon county, Virginia. How would the markets there be for stock and poultry products. There seems to be a lack of railroads, according to the map we have. Does Washington take everything, or what are the main markets? Do alfalfa and the clovers thrive there?

Have you any knowledge of Ocala, Marion county, Florida, and if so, what is your opinion of that country for general farming such as we have mentioned. You wrote of the Florida climate as being unfavorable for poultry; in what way is this the case?

What particular section of Loudon county would you recommend, if you have any choice in the matter, and what town? At about what price could a small 40-acre farm be purchased there?

Our principal object in moving from here is to get to a warmer winter and escape the long continued presence of snow, with consequent confinement of stock and poultry.
Wisconsin.
U. McAslin.

Loudon county, Virginia, is in my opinion, the best agricultural county in all the south—none excepted. Washington, D. C. will take your poultry and other stock products each day in the

...This Year... SAVE YOUR BABY CHIX BROODER \$4.96

Cut herewith shows the *Putnam Home-Made Brooder* complete — "A perfectly simple and simply perfect" **LOW-COST** Brooder for saving your Baby Chicks, either those you hatch yourself or those you buy.

See Sample Brooder at Left

Guarantee

I guarantee the Putnam Brooder Heater to give satisfaction or it may be returned to me within 30 days of shipment and the money paid for it will be refunded.

Advantages of the Putnam Home-made Brooder

REQUIRES filling BUT ONCE A WEEK—no other attention. Patented principle—**EFFICIENCY** guaranteed. Thousands in use. Every **OTHER BROODER** must be filled and trimmed **SEVEN TIMES** a week. Putnam **HOME-MADE BROODER** is adapted to any size plant from 25 to 60 chicks in one brooder to any greater number desired; simply use more brooders. Is particularly adapted to needs of small breeder and back-lotter who aims to produce one lot of chicks or a few dozen.

No other brooder on the market is **EASIER** or more **SIMPLE** to operate; none uses **SO LITTLE OIL** per chick; brooder consumes less than a gallon of oil **A MONTH**. Send for and read the testimonials.

Putnam **BROODER HEATER** is so constructed that it acts **LIKE AN OPEN FIRE PLACE**, carrying the foul air out and drawing the fresh air in, thus providing **PERFECT VENTILATION AUTOMATICALLY**.

Heat is radiated from **ABOVE** onto the backs of chicks, giving the natural and soothing effect **OF THE HEN**—without the lice.

Hover is so constructed that chicks **FIND EXACT TEMPERATURE THEY LIKE**. Adjustable hover takes care of any season from February to July.

Putnam **HOME-MADE BROODER** CAN BE OPERATED ANYWHERE in a sunny room in a house, an open shed, or, if a roof be built on it, out of doors; can be **CARRIED ANYWHERE** by a half-grown boy.

No other brooder is easier to clean and disinfect. Simply lift out hover and heater—brooder can then be emptied of litter and be disinfected.

Brooder heater is made of brass and galvanized iron—**IS PRACTICALLY INDESTRUCTIBLE**.

Capacity of Putnam **HOME-MADE BROODER** IS **ELASTIC**. When chicks require more exercising space, heater and hover can be placed in larger box or other structure. **THE BROODER GROWS WITH THE BROOD**.

Floor of this brooder is even with the ground and therefore chicks do not have steps or inclines to learn, thus avoiding loss from rain or chilling.

To summarize: At no price, **HIGH OR LOW**, can a brooder be bought so economical in first cost, also in fuel and labor—so simple and **EASY TO OPERATE**, so perfectly ventilated, or one that will so surely raise **HEALTHY AND VIGOROUS BIRDS**.

THE BROODER HEATER
Price only \$4.75, Postpaid.

IN SUCCESSFUL USE FOR YEARS

THIS BROODER HEATER is in no sense an experiment. It has been on the market **IN SUCCESSFUL USE** for years. Thousands of them have been sold and they have given uniform satisfaction. Here are sample reports—could furnish hundreds of others like them:

ROBADEL FARM USING 24.

Cos Cob, Conn., April 24, 1918.

I enclose herewith my check in payment for the 12 Putnam Brooder Heaters sent me by parcel post. They arrived safely on Monday. Will be very glad if you will send me another dozen heaters some time this week or next. It is our intention to use these brooders entirely instead of hens, as we have come to the conclusion that they are really more practical than the mother hen.

ROBADEL POULTRY FARM,
Per A. C. Robertson.

Fulton, N. Y., May 11, 1920.

We received the Brooder Heater in time and we would not part with it. I have 200 little chicks which we have raised in this brooder and they are doing fine—have not lost one yet. Before we had this Putnam home-made brooder we lost many by their getting chilled when small. MRS. C. W. BENNETT.
Route 1.

Jefferson, Ore., May 8, 1919.

Enclosed find check for which please ship me 2 more Putnam Brooder Heaters. Want these to use myself. These heaters of yours used in home-made

brooder boxes have anything else beaten that I have seen yet. E. J. SHUMAKER.

Magnolia, N. J., April 13, 1920.

Enclosed find P. O. money order, for which send me 2 more Putnam Brooder heaters and one dozen wicks for same. Kindly rush order. Through me you have sold several of these Brooder Heaters, and I certainly do enjoy teaching others how to use them. There is nothing else to equal it on the market. I am well pleased with this Brooder Heater and always praise it just as I have done in this letter.

W. B. BARTH.

How to Order:

I do not sell the Putnam Home-made Brooder. I sell the Brooder Heater only. The price of Heater is \$4.75 postpaid. With every Brooder Heater I will send **EASILY FOLLOWED DIRECTIONS** for making the Home-made Brooder. Your dealer should have the Putnam Brooder Heater in stock. Ask your dealer for it, or I will fill your order, all charges prepaid, to your address at the regular price of \$4.75 each. Please send me your dealer's name. Reference by permission, Editor this Journal.

I. PUTNAM Route 105 **ELMIRA N.Y.**

BALDWIN OF BRIDGMAN.

Any one who knows will tell you that Michigan is a great Fruit Growing state. All varieties grown in any of our Northern States do remarkably well in Michigan. Climatic and soil conditions are ideal—Berry Plants grown in Michigan are best—better still when grown on New Ground—Baldwin grows them that way.

Nothing better than berries and small fruits to preserve health and maintain happiness during these reconstruction days. Our plants are true to name. All free from diseases. All northern grown on new rich ground, producing strong, healthy, large, heavily rooted plants. Millions of them, as good as ever were grown, offered our customers this year. We have had a wonderfully successful growing season.

Baldwin's Berry Plants

produced by Baldwin himself, are sure growers. Every grower or prospective customer, large or small, may have our big handsomely illustrated and thoroughly descriptive Berry Book. It contains valuable information, showing how to plant and produce successfully, delicious fruit from Baldwin's Berry Plants. It explains how to have the earliest berries in the Spring and the latest berries in the Fall. For home garden or market purposes, for pleasure or for profit, Baldwin will show you the way. Start right. Write tonight.

Brown Fence & Wire Co., Dept. 23 Cleveland, O.

year at good prices. Alfalfa and clover grow to perfection there.

Marion county, Florida, of which Ocala is the county seat, is in the northern part of the state. It is too far north for the sure growing of citrus fruits and vegetables, although fruits and vegetables are raised there in considerable quantity. It is more a farming country, but can in no degree compare with Loudon county, Virginia, as an agricultural section. I advise you to go to Leesbury, Loudon county, Virginia. This is the county seat and a splendid business town. Call on a banker and tell him what you desire to purchase. He will put you in touch with those who can best serve you. You cannot buy land there at a low price. It is rich productive land, and is worth the price asked. The climate is ideal, the water of the best, and the people—well, there are no better people in all the world than those of this section of Virginia.

* * *

I expect to order some apple trees from Stark Bros. for next spring, and wish to order Stark's Delicious, Golden Delicious, and Liveland raspberry (early). Would this be a good selection, or if not, what would be the best trees to plant in this locality (eastern Massachusetts), about twenty miles from the coast? High land, clay soil. Also, what kind of cherries and peaches would be best for here.

Massachusetts.

You have made a splendid selection of apple varieties. Allow me to suggest that you add thereto the Henry Clay apple. This apple is very early. Also the McIntosh Red. This is an apple admirably adapted to your locality. Is an early winter apple of very high quality. Advise you to plant Montmorency cherry. Peaches: Rochester, Early Elberta, J. H. Hale and Krummel.

* * *

Have always been interested in farming, especially fruit growing and poultry raising, and for the last ten years have looked forward to the time when I could get away from the close work that I am now engaged in and devote my entire time to work I enjoy.

Recently returned from a trip to Forest county, Wisconsin, where I bought eighty acres of cut-over land. This land is rolling but very productive. Of course, will want to plant a home orchard and some small fruit, and need your advice as to which varieties to plant of apples plums and grapes. What small fruit? Do you think Delicious and Golden Delicious would do well up there? Prof. Hansen's hybrid plums should be naturally adapted to the climate? Which ones would you recommend, and what other varieties would you plant?

I notice on this cut-over land the red raspberries grow wild, and I understand hundreds of quarts go to waste. Am going to try a few Royal Purple to see what they will do.

What do you think of the possibilities of a commercial orchard in that location? Was shown several eighties that were too rough to cultivate, covered with boulders, and which could be bought reasonably. Thought maybe it would pay to buy eighty acres of this land and plant to apples. What varieties should I plant?

Wisconsin has a fine system of highways; her people are progressive and neighborly; the country abounds in lakes and streams, and the fishing and hunting are all that could be desired. Any man of small means looking for a location should investigate the possibilities of this cut-over land in Forest county.

Wisconsin.

E. F. McFadden.

Wherever I receive a letter like this my blood tingles and I long to take a hand in the development of such an orchard.

Let us first consider the question of planting a commercial apple orchard on the rough land referred to. An orchard of McIntosh Red, Wealthy and North-western Greenings would be a valuable income producer. I strongly advise you to make such a planting.

Get More Eggs

Light the hen house a few hours each night and morning with the Coleman Quick-Lite Lantern. Longer feeding hours increase egg production.

'Coleman Quick-Lite

"The Sunshine of the Night"

Brilliant light of 300 candle power. Plenty for hen house of good size. Makes and burns its own gas from common motor gasoline. Lights with matches. Durably made of heavy brass. Mica globe; stands rough handling. Won't blow out in any gale.

For very large hen houses we manufacture the same form of lighting in a complete plant, equipped with fixtures, globes, outside fuel tank, etc.

THE PROGRESS NURSERY COMPANY
1319 Peters Avenue Troy, Ohio

For home use plant Duchess, Wealthy, McIntosh Red, Northwestern Greening and Stark Delicious. Delicious is hardy for north of the section you refer to. I would test out Golden Delicious by all means. Yes, Professor Hansen's hybrid plums will do well there. Would plant Sapa, Hanska, Waneta and Opata, also Desoto and Terry. Think you should put in a few Compass cherry. The Beta grape will give you good results. You certainly will want to plant some Houghton gooseberries and Red Cross and Fay currants. I am not sure Royal Purple raspberries are hardy enough for that climate, but you are wise in testing it out. Try out some of the standard raspberries also. I wish you full measure of success in your new home. Write me as to your operations. I am interested in your undertaking.

* * *

I own a small farm in Crawford county, Indiana, and am in the poultry business in a small way. Am wanting to put out a small number of trees in the poultry run. Want to know the best cherries, plums, pears, apricots, and which of them would be best for the part of the run mostly frequented by the poultry, as the ground there would be the hardest packed. Also tell me if it is better to set with dynamite? This run is on a west hillside and the ground is naturally hard. I am setting some apple trees and would like your advice as to the kind best suited to southern Indiana.

Charles W. Tucker.

The best cherry is the Montmorency. Plant Terry Surprise and Wyant plums. Do not put pear trees in the poultry runs. They will make too much growth and will badly blight. Plant Lincoln, Kieffer and Seckel pears. Superb is the best apricot. The plum does best in the poultry yard. Would not use dynamite unless subsoil is very hard. Advise you to plant Jonathan, Grimes Golden and Stayman apple trees.

* * *

I wish you would help to correct what seems to be a very wrong idea in regard to the growing of everbearing strawberries. Most of the growers, and in fact some of the people who are offering plants for sale, seem to think that one must wait one year for these plants to produce. This is absolutely wrong and is doing this industry a lot of harm. A plant set in April or May should begin producing about July 15 and continue to produce until heavy frosts in the fall.

Perhaps my own plan of raising this most valuable of all berries might help others, and I give you here the system that has proved most successful with me. I set the plants the latter part of March, as we usually have a few days of good weather in this part of the middle states, but if you cannot set the plants until the middle of May the same system will work.

I set the plants one foot apart in the row and have the rows two feet apart. This gives one a chance to cultivate with a horse cultivator if he so desires. The ground should be fertilized the year before, and I do not believe you can get too much fertilizer in the ground, provided it has gone through the heat. Work in every bit that the ground will stand; twenty tons to the acre is none too much.

Pinch off the first blossoms, that is, the ones that come in early spring, and do not fail to pinch off all the runners near the main stock. The plants will do their utmost to produce runners, and it is a real fight to get them to start the fruit blooms.

The plant should stand like a little spindling scrub until about the middle of June, and a man new in the game will just about give them up in disgust. But if you keep off the runners, you will notice about the middle of June that they are beginning to stool out, and in a short time you will find a great big bushy plant where ten days before you had only about four small leaves. From this plant the fruit stems will spring up from all sides, and it is no uncommon thing to see fifteen to twenty fruit stems on one plant and all bearing fruit.

Continue to pinch off the runners as you are picking the fruit, and remember you are working that plant for all the fruit it can produce in one year. Then, when the freezing weather comes, plow it under and set a

103-DEGREE INCUBATOR

THE 103-DEGREE INCUBATOR

Hatches everywhere, strong, healthy chicks that will live, because of many new patented improvements.

The Most Wonderful Incubator Invention Ever Thought Of
The Tilting Chimney—biggest incubator improvement in years—controls the heat before it enters the boiler, not afterwards. Impossible to overheat or underheat the eggs—guaranteed 103 degrees all the time. No need for an incubator cellar, any room will do. No fuss or worry, no getting up in the night, only one regulation. Guaranteed fully automatic.

Patented Two-Circuit Hot Water Heating System
The first really effective hot water heating system. Every cubic inch of the egg cabinet always at the same even temperature. Forces the water to keep busy every minute, no hot spots or cold spots.

Perfect Ventilation Guaranteed
The combination of the Tilting Chimney and Two-Circuit Hot Water Heating System makes it possible to thoroughly ventilate every part of the egg cabinet at all times. 103-Degree Incubators are guaranteed entirely free from odor.

Four sizes. There is a 103-Degree for every poultry raiser. 103-Degree Incubators get results anywhere. Guaranteed to adjust temperature variations of 66 degrees between high and low.

One Hatch Free
enables you to prove what others merely claim. All 103-Degree Incubators carry the most liberal guarantee ever made.

Lampless Poultry Fountain

The Rippley Triangle Double Cup Non-Freeze Poultry Fountain keeps water at drinking temperature summer or winter. Made of galvanized iron on principle of thermos bottle—two tanks with lined and sealed air space between them. No mechanical parts to get out of order. No lamp. Guaranteed. 2-gal., \$6; 4-gal., \$7; Round Style, Single Cup, quart, \$1.50; 1-gal., \$2.50. 2-gal., \$3.50; 4-gal., \$4.50; 5-gal., \$6.50.

Write Dept. A1 for catalog of poultry supplies.

RIPPLEY MFG. CO., Grafton, Ill.

new bed the next year. If you hold them over, do so to produce plants the second year only; and get this fixed in your mind, that a plant cannot produce runners and large berries at the same time.

The best plan to follow is to set out a small bed for runners, and do not allow them to set fruit buds at all. One plant in good soil, properly cultivated, will produce from 25 to 40 plants in one year, if you keep the bloom off.

Another thing I wish to warn people against are the fake ads and the advertising matter sent out by some growers. The idea that you can get rich on a little back lot raising everbearing berries all rot. They do produce a lot of fruit, but it takes a lot of fruit to make any big showing in quart boxes. About 250 plants on good soil and properly cared for will furnish sufficient fruit for a small family, and they will do this for about ninety days. But if you are going to try to make a living out of them, you should have from one and a half to two acres.

Another matter, and an important one: Please do not jump at the hook and swallow the cork and pole to get in on some of the new varieties. The old Progressive is the standard variety, and in my tests of others, none are anywhere near it in quality or production. Honest producers will tell you this, and the best breeders of overbearing berries are using the same system as the poultrymen, that is, trying to make this variety better by careful selection rather than waste their time on imaginary crosses. The fruit is all that anyone has claimed for it. It is one of the sweetest of strawberries. It is not quite so large as the standard or spring bearing varieties, but during a season will produce more fruit than any of the standard plants. It is a good keeper and will stand up for twenty-four hours during the hottest weather.

Naturally, any fruit out of season commands a higher price, and there is a good profit in the production of the everbearing strawberry, but it cannot be done by setting out the plant and letting it go at that. It means constant attention, and if you have two acres in cultivation you had just as well cancel all other engagements, for this little plot will keep you busy. Theo Hewes.

Indiana.

I am more than glad to have this statement by friend Hewes and am sure our readers will be benefited by carefully following Mr. Hewes' advice.

Poultry Clubs in Arkansas.

If anyone thought that the boys and girls of the poultry clubs promoted and directed by the home demonstration agents of Polk, Miller, Garland, Little River, and Hempstead counties, Arkansas, cannot produce as good birds as expert, he would have changed his opinion had they attended the fair at Texarkana.

The first Barred Rock pullet which was produced and exhibited by a Polk county club boy, Tony Hale of Mena, was an outstanding bird in her class. She scored 94 points. Besides winning first in her class she was awarded sweepstakes for the best pullet of the entire show. The bird was sold for a fancy price.

Sweepstakes for the best Wyandottes, both white and silver, were won by members of poultry clubs and their birds were sold for fancy prices. The first prize, \$25 in gold, for the best and largest poultry club exhibit was given to Miller county; second prize, \$15 in gold, was given to Polk county; Garland county won third prize, \$10 in gold, and Hempstead won fourth, \$5 in gold.

About 40 purebred cockerels raised and exhibited by club members were sold at this fair to be distributed among farmers to improve and grade up the farm flock.

Poultry club work will without doubt, be responsible for many Standardbred flocks on farms in Arkansas. The common mongrel fowl is being chased from the tree tops and wood sheds to be replaced with uniform Standardbred birds. The result is a better class of poultry going into the markets.

A marked improvement and increase in number of fowls exhibited has been noted at the 14 county fairs which I have attended this fall. H. B. Lansden.

Purebred Poultry in Louisiana.

I have just completed a five weeks' trip throughout the state, including the Mississippi State Fair, and can frankly and candidly say that the Standardbred poultry industry is progressing more rapidly at the present time than it ever has during the history of this southern country. The show this year at Jackson, Mississippi, Hammond, Franklinton, Shreveport, and Shreveport (Louisiana State Fair) have exceeded in number and quality any previous exhibitions. I look forward to a great deal of progress in poultry work in the south during the next several years. Harley L. Williams.

Dont Send 1 Penny

Just send your name and address, size and color and I will send this sweater to you. You don't pay one penny until it is delivered to your door by the postman.

Army Navy

For Men or Women

This is a real heavy winter sweater made of heavy mixed marino yarn. Slip-over style, with V neck and full length sleeves. Just like picture. Will give excellent wear. Sizes to fit Ladies or Men 34 to 46. Colors, khaki or navy blue.

THE STORY OF A BACK YARD FLOCK.

By H. L. KEMPSTER.

E. J. Durand, a resident of Missouri, is an enthusiastic advocate of the back yard flock. He had had no previous experience with hens aside from a very general boyhood contact with them on the farm. This experience had been such that he was not enthusiastic about keeping hens for egg production in winter. Mrs. Durand was appalled at the prospect of paying 60 cents, or more, per dozen for eggs for table use. At the suggestion of Mrs. Durand and with the aid of a circular issued by the Missouri Agricultural College three years ago, Mr. Durand decided to keep a few hens. (In that circular the writer told of ten White Leghorns producing 749 eggs between November 1 and May 31, at a feed cost of 14 cents a dozen.)

"The results were such as to make me an ardent advocate of the back yard flock," writes Mr. Durand. "I intend to keep one whenever opportunity offers. I derived good fun and exercise out of planning and building the house, from old material, at a minimum expense. The fowls were far less care and trouble than I expected them to be, and the garden soil was much richer from the litter thrown out from the chicken house. Although every particle of feed, aside from table scraps, was bought at retail prices in the local markets, the eggs cost us less than 16 cents a dozen. At this low figure we felt justified in using them freely for cooking purposes and the table with a consequent decided reduction in our meat bill. Not the least return was the pleasure derived from daily contact with the hens themselves. I grew to regard them as pets, which were worth while in that they rendered some return for their keep. Some satisfaction was also felt in the economical use of table scraps on the place."

The Chicken House.

The chicken house was built out of a piano box and a miscellaneous assortment of old boxing and crating material which had accumulated. The total cost, not counting time, was \$5.50, which went mostly for the window, studding, hardware and especially for roofing material of good quality, with which the house was completely covered to make it snug and warm. Since the house will probably last five years with little or no repair it seems reasonable to figure the cost at a dollar a year. The house was built in 1917, which fact should be remembered, as the building cost at present would probably be double what it was then.

The Flock.

The flock consisted of a dozen White Leghorn hens of uncertain age, but mostly one year old hens. They were put in the house October 21. Eight hens which had stopped laying were killed for the table at intervals from July 8 to August 16, the following summer. Since the remaining four, sold August 25, brought at current market price 13 cents each more than they originally cost, it seems fair to disregard the original purchase price on the ground that it was offset by the food value of the fowls used.

BREEDERS--PULLETS--COCKERELS HATCHING EGGS AND BABY CHICKS

These birds have thirty years' of endeavor and line-breeding behind them. Look at their egg records—from 180 to 256. These are the money-makers. Figure it out for yourself, with eggs at \$1.25 per dozen. No time like the present to get started with one of the following varieties:

White and Buff Leghorns, R. I. Reds, Barred and White Rocks, White Wyandottes and White Orpingtons

FEED YOUR CHICKS FREE!

The proprietors of Kerlins' Grand View Poultry Farm are pleased to inform the readers of American Poultry Journal that three years ago this farm, owned and conducted by A. E. and W. W. Kerlin (father and son), Center Hall, Penn., initiated a system of furnishing FREE, with each order for their celebrated English-American "Kerlin—Quality" 265-270 Egg Strain S. C. W. Leghorn Baby Chicks, ONE BAG KERLINS' FAMOUS STARTING FOOD for BABY CHICKS. This is done for the sole purpose of assisting the customer in getting his chicks started right for the first few weeks or a month.

Last season the Kerlins gave to their customers, ABSOLUTELY FREE, 24,000 POUNDS of this Starting Food. Into every State in the Union this feed was shipped and back came reports of the splendid vitality of the chicks received and the wonderful success by feeding the free feed.

The Kerlins are again preparing to ship Free Feed and we know this information will be of interest to our poultry-raising friends. You will find Kerlins' advertisement on page 1206. Read it and ask for BOOKLET No. 3, which will give complete information about their splendid stock, Free Service Department, etc., etc.

HARTFORD, WIS.

The MAGIC Brooder

Self-regulating; efficient, and high-grade throughout; built with top and bottom draft; gas-proof chamber (the only brooder with this improvement), rocker grate and improved regulator. Will brood strong, vigorous chicks.

Reader, the success of raising poultry depends on the brooder. It must hold the fire and never go out. You only have to kill a chick once to be dead. Even one good chill will ruin them for life. Buy the Magic—the most dependable brooder in the world; it **insures success**. The writer, C. V. Hill, gathered in December over 1,000 eggs per day from 2,300 layers raised with the Magic brooders which net a clear profit of \$40 to \$50 per day. Come to Trenton and visit my Poultry Plant and see for yourself.

OUR GUARANTEE—Will refund money in 30 days if brooder does not do all we claim. Write for free catalog describing the Magic brooder together with plans of colony and laying houses. Live agents wanted in territory not taken. Address,

LILY WHITE POULTRY FARM

R. 1

COMSTOCK PARK, MICH.

An extra hen was also kept from January 3 to March 29, during which time she laid 46 eggs.

The hens were kept shut up constantly, and never left the house, the house being six feet square. Yet they kept in perfect health, and did not seem to suffer any ill effects of any kind (much to the astonishment of the neighbors). They never bothered anyone's gardens, nor caused a word of complaint. Moreover they laid more eggs than did a neighbor's precisely similar flock, which ran out, and he was finally convinced that for more reasons than one it was better to keep hens shut up.

Feed.

In addition to the table scraps which formed only a small portion of the ration the hens were fed each morning about 12 ounces of scratch feed (a mixture of cracked grains such as corn and wheat). At night the same

Suitable back-yard poultry house for Missouri climate. In this house Prof. Kempster kept 10 White Leghorns, which gave a yield of 749 eggs in seven months, November to May, inclusive.

amount of grain was again fed, each hen receiving about two ounces of grain a day. A dry mash (a mixture of ground feed, such as equal parts by weight of bran, middlings, corn-meal and commercial meat scrap) and broken oyster shell were kept constantly available, hoppers being used for this purpose, the mash being fed dry. A 50-pound sack of this mash lasted twelve hens about two months. Fresh water was given morning and night. Two bales of straw with dead leaves and grass raked from the lawn were used for litter. During the growing season a little fresh cut grass and clover was thrown in every day or two. The cost of the feed was as follows:

350 pounds scratch feed.....	\$13.80
200 pounds mash.....	7.90
Oyster shell.....	.40
2 bales straw.....	.60
1 bushel shelled corn.....	1.25

Total.....\$23.95

The shelled corn was practically wasted, since it was musty and the hens did not eat it well. Careful figuring showed that at current prices an average of three eggs a day paid for the feed consumed.

While the above prices represent 1917-18 prices they are approximately the same as for 1919-20. The current price for mash and scratch feed in Columbia is \$4.00 per 100 pounds.

A careful daily egg record was kept

High-Priced Winter Eggs Produced Via the Sprouted Oats "WAY" Means Larger Profits

Get the Facts About Our Grain Sprouter. Learn What It Has Done for Your Brother Poultry Raisers and What We Guarantee It for You

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1921 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" Grain Sprouter

**Practically All Steel—
Made in Sections
New Safety Lamp Insures Doubly
Against Accident**

Double steel walls—metal trays. There is nothing else like the "Successful" Sprouter. It's a brand new idea. Cannot be compared to wooden sprouters. It is warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold.

Made with glass doors. Each section a separate compartment. Start with just enough sections for your needs and add more as you need them.

Here is a money maker that proves its worth right at the

Test seed corn and start your plants the easiest and surest way with this Des Moines Grain Sprouter.

20 lbs. raw (3 pecks) oats as shown above makes 70 lbs. of sprouted oats as shown below in the "Successful" Sprouter

This in one week's time—the best green egg-making feed obtainable.

SPROUTED OATS

Read These Letters From Owners

Enjoys a 60% Egg Yield

Big Run, Pa., Jan. 20, 1920.
Gentlemen: Have had splendid success with your Sprouter. Incubator and Brooder secured last season. Very few people secure eggs this winter, but I have been getting about 60% from my flock. I know this is due to feeding correctly sprouted oats. I think the sprouter is just wonderful.

Mrs. Jno. L. Kelly,
Box A25.

80 Hens Averaged Nearly 25 Eggs Per Hen for a Month

Salem, Ore., Apr. 5, 1920.
Dear Sirs: Your sprouter is the thing. Would not be without one since I have seen how sprouted oats increases and keeps up the egg yield. One flock of 80 hens averaged nearly 25 eggs per hen for the month of March. Many are getting interested in it.

Harold F. Phillippe
2199 Fairgrounds Road.

start. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day is all that's needed to increase the egg yield. And at the same time you cut your feed cost one-third and settle your green feed problem once and for all. Write for full details.

Geek Court & Co., Inc., 5130 W. Madison St., Chicago

which may be summarized as follows:

	Eggs.
October, 11 days.....	7
November	94
December	65
January	84
February	156
March	247
April	223
May	240
June	195
July	173
August, 25 days.....	69

Total.....1,553

The average for the 309 days was a little over five eggs a day, of which two eggs were profit above feed cost. Since the total cost, including house, was \$24.95, the 129½ dozen eggs received cost a little less than 19½ cents a dozen. At no time could eggs be bought in the local markets for less than 30 cents a dozen, and during

Cross section of Prof. Kempster's back yard poultry house.

much of the time they were sold for 60 to 65 cents. A low conservative price was 35 cents per dozen (this figure represents the minimum price at which the consumer was able to buy eggs during 1919). On this basis the profit was 15½ cents a dozen or \$19.60, an average of \$1.63 per hen.

Of the 126½ dozen eggs produced, 27 dozen were sold to neighbors for \$8.98. Therefore the remaining 102½ dozen eggs actually used in the household cost \$15.97, or a little over 15½ cents a dozen. By keeping a backyard flock Mr. Durand's eggs actually cost less than one-half what he would have otherwise had to pay. Moreover he had the satisfaction of knowing that every egg was absolutely fresh and above suspicion.

"I have been asked more than once," says Mr. Durand, "if the hens did not require lots of time and trouble. It is a conservative estimate that 15 minutes per day was spent in feeding and watering the hens and collecting the eggs. The total profit of nearly \$20 certainly was ample compensation for this outlay." No wonder he is an ardent advocate of the back-yard flock.

Live stock journals publish monthly the prices at which animals change hands at important sales, and they give the name of the buyer as well as that of the seller. Thus the public is apprised of the prevailing prices for valuable animals in purebred live stock. But, it rarely ever happens that the prices for fine chickens are recorded in a public way, but good fowls, like silk, not purchased at the prices of calico.

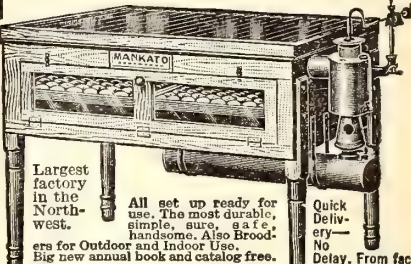

MANKATO INCUBATORS

The American Breeds of Poultry

Twenty-six chapters:—
The following are contents
of first five chapters only:

Chapter I

Origin of the American Breeds—
Origin of the fowl—Fowls in do-
mestication—Introduction of the
fowl to Europe—Important de-
velopment of fowls in Eastern
Asia—Origin of the Chinese stock
is unknown—The Malayan stock—
Introduction of the Asiatic types
to America—Cross breeding that
lead to the production of the
American breeds—Appearance of
the Plymouth Rock, Wyandotte
and Rhode Island Red.

Chapter II

A Dual Purpose Type—Utility
qualities of the American breeds
—As meat producers—Special
breeding for meat type—Grading
up for size—What buyers of mar-
ket poultry prefer—As egg pro-
ducers—Eggbred males for in-
creasing egg production—Pure-
bred birds as layers—Effect of
laying on breeding power—Future
for the dual purpose type—High
prices for purebred stock.

Chapter III

The Breeder: His Place and His
Work—The place of the breeder—
Breeders supply seed stock—Qual-
ifications of a breeder—The poul-
try show—Analyzing the quality
of a specimen—The work of the
breeder—Building a strain—Value
of selection—Natural selection—
Inbreeding—Linebreeding—Value
of linebred birds—Variation—Pre-
potency—Principles of breeding—
Inheritance of rose and single
combs—

Chapter IV

Breed Type—Judging the shape
of a bird—Relation of size to type
—Importance of plumage—Plu-
mage adds finish—Body shape and
typical shape—Body shape of good
layers—How to cull the flock—In-
ternal organs—Selecting breeders
for shape to produce heavy layers
—Body shape for meat production
—Typical shape of breeds—Sym-
metry—Sections considered in
judging—Shape of each different
section described, head, neck, back,
tail, breast, body and fluff, legs,
toes, eyes, beak, etc.

Chapter V

Color and Structure of Plumage
—The beauty of plumage—The
fancier as a student—Utility of
the plumage—Structure of the
feather—Male plumage—Texture
of the plumage—Size of feathers—
Colors found in the plumage—
White plumage—Inheritance of
white color—Color patterns—
Breeding color and markings—In-
heritance of barred color—Double
mating—The growth of plumage—
The molt—Fall, molt of pullets

A new book
of 256 pages,
100 illustrations; printed on heavy
paper and binding is of brown cloth

An entirely new text, in which the author goes back to original
sources, and starting at the beginning writes a history of the
American breeds, tells of their origin, and traces each step in
their development. Every detail on the mating of each variety
is given in a plain, practical way.

Nothing like it ever before written. The book is a romance
of the American breeds, easy and fascinating to read, practical
and trustworthy in every particular. All you want to know
about origin, history, breeding, mating and showing of

Barred Plymouth Rocks
White Plymouth Rocks

Dominiques

Full details on breeding for meat and eggs as well as all standard points.

Written by Frank L. Platt, editor American Poultry Journal, breeder of
practical experience and judge for years at the great New York, Boston,
Philadelphia and Chicago poultry exhibitions.

If you do not find that this is the greatest breed book ever written and are
not more than pleased, send back the book and we will refund your money,
promptly and cheerfully. Here is what a prominent breeder says:

*"I return the manuscript for the Partridge Wyandotte chapter. The chapter is
the most wonderful thing I have ever read on Partridge Wyandottes. With all
the other chapters as valuable, the book will be a work in a class of its own, and,
as a product, worthy of the man holding the leadership among all writers."*

—T. W. Schoen, Sunbrier Farm

Remember that nothing is cut short.
Every variety is handled with greatest
pains and fullest detail. There is a long
chapter on every single breed and variety.
It is the most elaborate and costly book
that we have ever published. It is the
only exclusive work ever offered to the
public on the breeds that were made in
America by the genius of American
breeders. We know that this great book
will fascinate the breeders of today.

Old hands and beginners alike will profit
by the secrets of the master breeders

which are told by one who knows. You
are given a knowledge that will enable
you to stand shoulder to shoulder with
the leading breeders of America. The
reader who will spend 15 minutes a day
in the companionship of this book will
soon acquire a fundamental knowledge
of breeding and mating, and he will know
the tendencies that lie hidden in his vari-
ety. The knowledge you will gain from
this book will add \$2.00 worth of value to
every bird you breed.

**PRIZE
WINNERS**

Mr. & Mrs. Chas. V. Keeler.
The Keeler strain of White Wyandottes
takes front rank among the world's best-
bred poultry, famous as prize winners

Keeler, Poultry Judge and Breeder, Tells How to Get More Eggs

Tested Don Sung on 30 of his famous prize-winning White Wyandottes

"More eggs, better hatching eggs and healthier chicks," says Mr. Keeler.

Everybody who knows anything about the world's finest, best-bred poultry, knows of Chas. V. Keeler. His White Wyandottes have taken so many first prizes in all the leading poultry shows, that a list of them would fill several pages. The Keeler strain of White Wyandotte has been carefully developed for over 25 years.

Mr. Keeler is also one of America's best known poultry-show judges, and a recognized authority on the feeding and care of poultry.

His letter, printed below, points a moral to every poultry raiser who wants more eggs and better eggs, in any season.

"Gentlemen:

Having heard so many wonderful reports about your Don Sung, I began to wonder if I wasn't overlooking a good bet in not using it, or at least trying it out.

I have always been very skeptical about egg-laying preparations. Anything that would force the hen would be against nature, and harm-

ful. But Don Sung doesn't work that way.

Don Sung is a wonderful, helpful tonic. I know from watching the effect on hens that were out of condition, that it works with nature, not against it. It helps the sick hen, and makes the well hen stronger.

And for getting eggs, it is a marvel. I tested it on 30 of our prize-winning White Wyandottes during the least productive season last winter. The temperature ranged from zero to 15 and 18 degrees below. To my surprise in two weeks these 30 hens that had been laying nothing, were laying 21 eggs a day. These birds have been among my best producers ever since. Furthermore, the hatching results from their eggs have been way above the average.

Don Sung certainly helps get more eggs, better hatching eggs and naturally better chicks. We are glad to recommend it heartily."

—Chas. V. Keeler.

Your Hens Can Lay Well, in Cold Weather

Too many people have the idea that hens won't lay in cold weather. That idea is wrong. Notice that Mr. Keeler actually increased his egg yield right at a time when the thermometer stood at zero to 15 and 18 degrees below zero. Hens will lay all winter long, if given a helping hand instead of being neglected. The best of hens will be non-productive, if allowed to become run-down and in poor physical condition. Most of them

will lay if given the right kind of help. Don Sung is the tonic that sets them scratching, helps keep them vigorous, and active. The natural result is more eggs, in any weather.

Get Eggs All Winter

You don't have to be a poultry expert like Mr. Keeler to get more eggs in winter. Thousands of owners of back-yard flocks have written just such letters as his. Their eggs may not be as valuable as Mr. Keeler's famous pedigreed eggs, but all eggs are valuable enough at present prices.

All of these people—users of Don Sung—are getting lots of eggs—every day—right through the coldest weather. Don Sung is guaranteed, and you are free to try it without risking a penny. It is no trouble to use—simply give it with the feed.

Better Hatching Results

Notice what Mr. Keeler says on this point. It's important. It stands to reason that eggs from vigorous, healthy, active fowls should clearly be better than eggs from lazy, weak, run-down birds. Thousands of users of Don Sung say that eggs from hens that have had Don Sung are making new records for big hatches of better, healthier chicks.

What Don Sung Is

Don Sung (Chinese for Egg Laying) is a product of the Burrell-Dugger Co., manufacturing chemists—the world's largest exclusive manufacturers of poultry remedies. It is prepared under the personal direction of Dr. A. C. Burrell, V.M.D., and is a scientific tonic, regulator, and conditioner for hens. Don Sung doesn't force or hurt the hen in any way. It improves the appetite, tones up the egg-laying organs, builds up the system, and helps keep the hen in perfect health and vigor.

Your Local Dealer Has It

Don Sung is sold by the leading druggists and poultry remedy dealers everywhere. No need to send away for it—your dealer saves you all that trouble and delay. What's more, he stands behind it and will see that you get satisfactory results or your money back. Ask him about Don Sung. He can tell you what results it is producing for others in your neighborhood.

Costs Nothing to Try

We invite every poultry raiser to try Don Sung at our risk. Give it to your hens for one month, and watch results. If it doesn't pay for itself, and pay you a good profit besides, no matter how cold or wet the weather, your money will be cheerfully refunded. No strings to this offer—it is made by a well-known responsible company. If your local dealer hasn't Don Sung, he will order it for you. Or, if you prefer, write us enclosing 52c or \$1.04 (includes war tax) and we will send you a package by mail prepaid.

Burrell-Dugger Co.,
519 Columbia Bldg., Indianapolis, Ind.

How Well Will Culls Lay?

The farmers' "cull" egg laying contest, conducted at the Missouri State Poultry Experiment Station for the past twelve months, has ended.

The value of culling poultry, as practiced by experienced poultrymen, is not debatable. However, as many farmers and amateur poultrymen have been culling their flocks the last year or two by the methods employed by experienced poultrymen, which has been imparted to them by agricultural colleges, experiment stations and the press, it was deemed necessary to check up on them and determine, if possible, with what accuracy they were applying the points and characteristics given them by the above mentioned agencies.

It has been a general practice of county agents and others, after culling a flock of chickens, to insist that the owner retain the culls for from three to ten days, thereby proving beyond doubt that there was no mistake made in selection. In nearly every instance the birds classed as culls failed to produce any eggs during the time they were retained. The fact that very few eggs were laid by the culls during the time they were kept does not signify their unproductiveness nor does it mean they have never laid or never will. It does, however, signify an improper application of the points and characteristics that are used to successfully cull fowls.

As stated in previous reports, forty hens were selected by county agents and flock owners from four farm flocks from different parts of the state, representing twenty profitable and twenty unprofitable individuals. These hens were all healthy and vigorous and of the same age, but nothing was known of their breeding or past records.

During the last year these hens have been fed and housed under ideal conditions and an accurate trapnest record kept of each individual. According to these records, it is evident that in the majority of cases these hens were selected by application of the pelvic bone measurement, disregarding the several other points that could have been considered.

In each instance, those selected as unprofitable laid a few eggs less than those selected as profitable. As a whole, those selected as unprofitable laid 2,043 eggs during the contest, against 2,528 for those selected as profitable, the difference being only 485 eggs, which proves conclusively, as shown by the records, that there were culls selected as profitable hens, and vice versa. The fact is some of the poorest producing individuals were selected as profitable hens, and the highest producer among the forty hens was classed as a cull.

As a result of this contest, the fact has been brought out that poultry raisers are not efficiently applying the important principles in culling their flocks, which are vigor, condition of molt, body depth, quality of pelvic bones, breast bone, body and abdomen, body spread and pigmentation test.

A similar contest will be conducted again this year, except that the selections will be made by experienced poultrymen, thereby demonstrating the importance of efficient application of the principles of culling.

W. L. R. Perry.

Winter Rations for Farm Flocks.

The Standard ration recommended by the University of Missouri for the past several years is as follows:

Scratch Feed.

- 10 pounds shelled corn.
- 5 pounds dry threshed oats.

Dry Mash.

- 3 pounds wheat bran,
- 3 pounds wheat shorts and middlings.
- 1½ pounds commercial meat scrap or feeding tangle.

This is approximately the amount of feed which 100 hens should receive daily. The grain should be fed in litter of straw which is at least 10 inches deep, so that the birds will be forced to take plenty of exercise. The morning feed should contain a large portion of oats while the evening feed should be principally corn. The dry mash should be fed in self-feeding hoppers where the birds can have free access to it, and the amount eaten can be regulated by the amount of corn fed. If the mash consumption is too light feed less grain so that the birds will eat more mash. This ration has proved very satisfactory on hundreds of farms and is probably as cheap and as easy to obtain as any satisfactory ration which could be devised for farm flocks. T. S. Townsley.

A world full of feathered mongrels will
rior eggs and meat.
J. H. Drevensstedt.

Ironclad

TRADE MARK

150-EGG Ironclad Incubator

Don't class this big galvanized iron covered, dependable hatcher with cheaply constructed machines. Ironclads are not covered with cheap, thin metal and painted like some do to cover up poor quality of material. Ironclads are shipped in the natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad specifications: Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering. Large egg tray, extra deep chick nursery, hot water top heat, COPPER tanks and boiler, self-regulator, Tyco's Thermometer, glass in door, and many other special advantages fully explained in free catalog. SOL HOT

Blue Flame Wickless Oil Gas Heaters

My New 1920 Improvements Have Put Sol Hot Heaters So Far Ahead of Others There is No Comparison

FOR many years Sol Hot Heaters have been recognized by thousands of users of poultry equipment as the most simple, practical and dependable heaters on the market.

Letters from pleased and satisfied customers come to me by the hundreds every season, praising Sol Hot Heaters—everybody seemed satisfied with them but me. I knew there was none equal to them, but I wanted to make them still better—in adjustment of flame and oil flow—in short so far ahead of all others that there could be no comparison.

The Ideal Equipment

This I have accomplished with my 1920 improvements. Those who have used Sol Hot Heaters or other makes of heaters will quickly appreciate the big strides I have made this year in perfecting and making a still better heater for incubators and brooders.

My new Valve and Automatic Oil Control is one of the big features. With this new valve the oil can be shut off and turned on again without changing the oil adjustment. Flame can be turned out and restarted as often as desired. Adjustment screws are easily accessible—all improvements that owners of heaters will appreciate.

Then too, I have made and patented what makers of heaters have been striving for for years—an **All Metal Vaporizer**. Read my special offer on next page. This New Vaporizer certainly fills the bill—it's perfection in vaporizers—it has no asbestos ring to accumulate carbon and deaden the flame. This new vaporizer will fit all previous Sol Hot burners and all makes and sizes of other wickless oil burners. Don't fail to read my special vaporizer offer at top of next page.

H. M. SHEER COMPANY

This illustration shows the new valve and automatic oil control, "A" and "B" show how minimum and maximum of oil flow is secured. When once adjusted no further adjusting is necessary because with the auxiliary adjustment "C" the oil can be shut off without changing

adjustments "A" and "B" flame can be put out and lamp restarted as often as desired without changing adjustment. Note too that adjusting screws are within easy reach. This new patented Sol Hot feature means a big saving of time and trouble.

Above illustration shows the five different sizes of Sol Hot Burners. The oil consumption of these burners will range from a pint a day in the Baby Sol Hot to something over a gallon in the No. 5 Heater.

Here we show the new burner construction showing its simplicity and ease with which it can be taken apart for cleaning and reassembled. Notice the little spreader cap at the right has a plate on top which is adjustable; by means of the screw in the center this cap can be raised and lowered so as to evenly balance the air to both screens which permits burning a larger flame than would be possible without this adjusting cap.

(Pat. Applied For)

Non-Carbonizing All Metal Vaporizer

An Invention of Utmost Importance to Owners of
Wickless Oil Heaters

This new All Metal Vaporizer completely does away with carbon—no asbestos wick to carbonize and deaden the flame—flame always stays uniform. In addition being of metal it is practically everlasting, while asbestos vaporizers must be frequently renewed. With this vaporizer on your heater you can burn a lower grade of oil and maintain a smaller or larger flame because of the perfect vaporizing. Makes burner easy to start by using a little gasoline or denatured alcohol.

Here's my special offer to owners of old Sol Hot Heaters as well as owners of all sizes and makes of wickless oil heaters.

Throw away your old troublesome asbestos ring vaporizer—send me a \$1.00 bill tell me the size and make of heater you have and I'll send you this non-carbonizing All Metal Vaporizer that will end your heater troubles.

With your incubators and brooders equipped with the new famous Sol Hot Heaters your heating problem in connection with the hatching and brooding of chicks will be solved for good. These heaters are absolutely safe, give off no fumes, odors, gases, soot or smoke. No wicks to trim—no changing of adjustment. The Automatic Flame Control and the Famous Acme Compound Regulator insures uniform heat under all weather conditions.

With the many new 1920 improvements there is no longer any question about Sol Hot Heaters being the best, most dependable, most easily operated, most complete and perfect heating equipment on the market.

for Poultry Raisers

Write today for big free catalogue folder giving detailed description and prices of Sol Hot equipment. Don't buy equipment of any kind without first getting this free folder and learning how my new 1920 improvements have completely solved your heating problem in connection with the hatching and brooding of chicks.

The tremendous demand for the new Sol Hot Heaters, Canopy Brooders, etc., is so great that I will be able to accept orders for only a limited number of my Multidek Baby Mammoth Incubators this season. If interested in the mammoth plan of hatching, write at once.

My famous Regulators, Wafer Thermostats, Gas Valves, etc., are also fully described and prices quoted in my new catalog folder.

Don't put off sending for my new improved Sol Hot Heater Folder—its free for the asking and you'll find Sol Hot Heaters so far ahead of all others that you'll thank me for urging you to send for the free folder. If you value your time, labor, and expect results you really can't afford to consider any other heating equipment.

PLAINFIELD, ILLINOIS

Breeding the Silver Penciled Varieties.

Old breeders of Silver Penciled fowl cannot fail to be interested in F. L. Platt's article on Silver Penciled Rocks in the November American Poultry Journal. His admiration and frank enthusiasm for these birds is very welcome. From the viewpoint of one who has bred Silver Penciled Wyandottes for thirteen years, attended shows with a special eye on penciled plumage and talked its problems with many breeders, suggestions may perhaps be offered that will help those who think of taking up one of the silver penciled varieties, and which may contain some welcome news for Mr. Platt himself.

The writer is a minister, whose first interest is the Kingdom of God and whose second is silver penciled birds. Being always handicapped by small accommodations, which made double mating impossible, it was decided to mate for females only. In accordance with the prevailing ideas, the first males selected for pullet breeding had mottled breasts, broken striping in hackle and saddle and frosted thighs.

Feather From Silver Penciled Female.

These things were supposed to insure penciling in the female offspring. Pullets from these sires had white throats and light breasts, while mossiness in back and saddle feathers indicated too much dark pigment in those sections. Reasoning that the problem is to get dark pigment into the breast and less of it into the back, breeding males thereafter were chosen with black breasts, but broken striping and light undercolor in saddle.

This had the desired effect. A large majority of penciled breasts with greatly improved back and saddle feathers appeared on the pullets. The Boston show ribbons for males in this breed were being taken by birds with dark slate undercolor. Sometimes it seemed that they were judged by undercolor alone, for males with mottled breasts and brassy backs won from those with fine surface color, provided their undercolor was "strong." It was then impossible to exhibit a light undercolored male with any prospect of recognition. Notwithstanding the adverse judging, the few members of the New England Silver Penciled Wyandotte Club who were using the black breasted light undercolored males persisted in our plan because it was found to work well in unexpected ways.

With more even penciling, pullets were also showing less brown tinge. It is impossible to use a dark slate undercolored male without breeding brown females. The red feathers in cockerel's wings became infrequent, and brassiness gave place to beautiful silvery white where it is needed. Again it was found that, without trying for it, some cockerels showed good striping in saddle

Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high price food to lousy chickens. It's a dead loss—don't do it. Use "LICECIL." No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang uncorked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Licecil vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54, Quincy, Ill.

COSH'S Barred Rocks

Hundreds of magnificent birds, rich in the same blood lines as our great Trenton winners, are now ready to go into the show room or breeding pen for you and produce results.

We are offering grand scientifically mated trios at \$35, \$50, \$75 and \$100 a trio, and pens (one male and four females), at \$50, \$75, \$100, \$125 and \$150 a pen.

Grand breeding males at \$10, \$15, \$25, \$35 and \$50 each, and females at just one-half these prices. Or we will mate them in numbers to suit your personal needs.

Order immediately, while our line is still complete.

NEWTON COSH
Box A VINELAND, N. J.

America's Most Popular Poultry Magazine

4 MONTHS' TRIAL 20 cents
60c YEAR \$1 FOR 2 YEARS

The one poultry magazine for the fancier and commercial poultryman. Gives complete awards of leading shows, and treats on all phases of poultry raising—a Journal for the "back-lotter" as well as farm owner. Stamps accepted. Everybody's Poultry Magazine, Box 286, Hanover, Pa.

short, by mating solely for pullets we were producing males with standard surface color. Then came a change in judging, and these pullet breeding males won ribbons at Brockton Fair, Boston and Madison Square Garden.

This method of mating was advocated some twenty years ago by James S. Wason in a book on the Wyandottes. It was set forth seven years ago by the present writer in an article in the Poultry Item. That article received emphatic endorsement from Fred Rogers of Massachusetts, a poultry judge with long experience as a breeder of silver penciled birds, who had used this method long before with dark Brahmas. Mr. Rogers is now engaged along with Fred F. Field in breeding Silver Penciled Wyandottes, Silver Penciled Rocks and Silver Penciled Bantams. They are doing wonderful work on this line. It is unfortunate for the poultry fancier that the best equipped specialists on certain lines do not write, but leave it to an obscure preacher to "sling ink."

From the foregoing it is evident that not only can silver penciled birds be produced from single matings, but that it can be done so much better that way as to make it positively injurious to the breed to attempt double mating. Compensatory matings must be made, as in all breeds, in which weak points and strong characteristics are made to offset one another, but no two lines producing two sets of culis is needed. Pullet bred Standard exhibition males are easily produced, which can be used to breed exhibition females when mated with light hens.

The writer shares with others the conviction that these most beautiful of all birds have been held back from due recognition more by mistaken ideas as to mating than by anything else. They have all the practical advantages of the other American breeds with a plumage that appeals to the artistic nature in a large class of poultry lovers. If breeders who sell them will pass on to their customers these simple points on mating, there is an undoubted future for the Silver Penciled Rocks and Wyandottes.

Illinois. Rev. T. W. Harwood.

A Growing Interest.

It is especially interesting at this time to read the reports from the recent poultry shows, as there has been more interest shown in Silver Penciled Wyandottes this fall than in any fall since their inception. The specimens exhibited at the Canadian National Exposition at Toronto, the New York State Fair at Syracuse, the Western Fair at London, Ont., and the Brockton Fair at Brockton, Mass., this season were the best that have ever been seen; and especially at Brockton, where there were more Silver Penciled Wyandottes shown and of a better quality than any of the older breeds have ever had the pleasure of seeing.

Breeding Stock of Illinois Farms.

A survey of live stock conditions carried on by the County Farm Bureaus and Illinois Agricultural Association, reveals the fact that more than half of the sires used are grades or scrubs. Of the 28,796 farms surveyed in 32 counties, there are 4,897 registered bulls and 7,179 grade bulls. There are 4,574 purebred boars as compared with 3,333 grades. In the case of sheep, there are twice as many grade rams as purebred.

Prize birds are fed right from the start

The development of good stock begins with the first feed they get.

Not only does H-O STEAM-COOKED CHICK FEED give you more live chicks from every hatch but it promotes rapid, vigorous growth.

H-O STEAM-COOKED CHICK FEED

is the right combination of bone and muscle building material. Chicks mature more rapidly on it and develop big, healthy frames.

What successful breeders say:

Sebring, Ohio; Nov. 29, 1920

The H-O Company;
Buffalo, N. Y.

Gentlemen:

For a number of years we, as many other poultry-men experienced the disappointments of heavy chick losses. We soon found that our losses were due largely to bowel-troubles caused by the use of chick feeds containing sour or mouldy grains. We tested many different feeds in search of a satisfactory chick feed and were rewarded by our trial of H-O STEAM-COOKED CHICK FEED. Since our first test we have used no other chick feed and have been able to produce more winners and exceptional breeding stock than ever before, because of the fine start our chicks have been able to get. We would just as willingly try to keep house without a cook stove as try to raise chicks without H-O STEAM-COOKED CHICK FEED.

(signed) Yours sincerely,
R. E. Smoyer.

H-O STEAM-COOKED CHICK FEED is packed in handy five-pound packages, durable, space-saving and just the right size to feed. Also put up in the usual size bags 100, 50, 25 and 10 lbs.

Insist that your dealer gives you H-O STEAM-COOKED CHICK FEED and get the profits from live chicks.

Write for free samples, prices and descriptive folder.

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles should be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

HOW TO RUN AN INCUBATOR.

First Prize Article.

There have been so many articles written for and published in the various poultry magazines on this subject, that it seems almost impossible for one to suggest any new ideas; but maybe some of my own experiences as a poultryman will prove interesting and helpful to others.

In the selection of an incubator our first care must be to secure the best possible machine that can be afforded. It is a mistake to buy any incubator because it looks cheap and will surely lead to trouble in the end. The best is none too good in the choice of an incubator. It is of course impossible for me to mention my choice of machines in the columns of this paper, but I would say that any of the standard incubators, as advertised in the

American Poultry Journal, will give every satisfaction if handled according to the directions of the makers.

I am of opinion that the reason for the failure of a great many even experienced operators in the handling of these machines is because they either will not or do not follow the makers directions, introduce ideas of their own, and thus make a failure. I have handled various types and styles of incubators for some years and have found my best success was always obtained by implicitly following the "book."

One of the most important factors in artificial incubation is the room or cellar in which the incubator is to be operated, and, although, as most of the manufacturers will tell you, it is possible to run the machine in practically any room, it is far better to have it located in some place, a cellar

for preference, where an even temperature of from 50 to 60 degrees F. can be kept. Good ventilation is most important, and this must be obtained without causing any direct draft on the incubator. It is absolutely essential to have a current of pure, fresh air entering the machine, and provision made for carrying off the fumes of the lamp or the coal gas from a mammoth incubator.

It is also necessary to have a place for the incubator, where the floor can be thoroughly dampened with water if necessary during the process of incubation, as it is often necessary to supply moisture in this way. For this reason a cellar with a cement floor is far to be preferred to any other location. When setting up an incubator see to it also that it is set absolutely level, as, unless this is done, there will be a higher temperature in one part than in others.

Some makes of incubators do not have any moisture pans or sand trays, depending solely on ventilation as a means of increasing or retarding evaporation of water from the egg, and it will be found if the directions are closely followed in this case, that good success can be obtained. It will be found that it is necessary to keep from 40 percent to 65 percent of moisture

LORD FARMS LEGHORNS

Ask the Man Who Owns 'Em

The Lord Farms Organization is one of the most successful in the whole United States. Starting with White Leghorns eleven years ago, after fifteen years' previous experience with Rocks, Reds and Wyandottes, the Lord Farms today is one of the largest, if not THE largest White Leghorn Plant in the Eastern States.

Eleven years ago we leased a small farm in Methuen, near Lawrence, of twelve acres; in two years we bought the place. In two more years we bought twelve acres more, then again we purchased sixty more acres. Again we leased seven acres and twenty-eight acres of land that we couldn't buy. **THIS YEAR WE HAVE PURCHASED OUTRIGHT ANOTHER 260 ACRES FARM.** Besides the above we have leased for five years the second largest hatchery in New England for our ever increasing business.

It will take over 12,000 breeders to supply the demand for our Baby Chicks and Hatching Eggs in 1921. We have laid our plans to raise for our own use 40,000 to 50,000 White Leghorn chicks, and this amount will not fill our orders. This year we have been obliged to refuse orders for over 25,000 pullets which we would have sold at profitable prices.

We are doubling our business this year, and expect to be able to produce more than 250,000 chicks next season. Every chick we sell is produced from a Lord Farms strain egg, not any old kind of an egg picked up here and there.

The Lord Farms is a successful institution. The Lord Farms' customers are invariably successful, and you can be successful if you breed or buy our strain of birds. We could name you customers, one after the other, who use our stock exclusively—one man farms that are clearing four, five, six and even more thousands of dollars profit every year. "ASK THE

MAN WHO OWNS 'EM." That tells the story why we are successful.

For ten years we have been telling you that we had good stock that you could make money with. We never told you that we had 300-egg layers, very seldom even talking 200 eggs, because the average farm only has a few of these kind of birds. What we have been trying to impress upon you is that we have a strain of Leghorns that will lay as good and better than the average flock. We have laid especial emphasis on the fact that we had good looking, good sized, healthy Leghorns that lay good sized eggs. We have been emphasizing that our chicks were unusually healthy—chicks that were easy to raise, that made good uniform growth, that would lay on an average as good as any strain in the country. Thousands and thousands of customers have proved that our statements were correct, so that today we have a real Poultry business that we can depend upon year after year.

We are neither the dearest nor the cheapest place to buy chicks. We can't sell Leghorn chicks as cheap as common hatcheries, who pick up their eggs indiscriminately and don't spend one cent in producing stock. Neither do we try to profiteer on our chicks. Our prices are reasonable for the high cost of the stock we produce. With the profit there has been in the Poultry Business this year (eggs are selling here at \$1.25 a dozen) there will be the biggest demand for chicks this country has ever known next Spring. Already we have booked five times as many chicks so far as we have ever done before. At the present writing we have over 75,000 chicks sold for next season, and this ad was written in October. Get busy and get your order placed early this year. Our first hatch comes off February 15th. Place your order now with a 25 per cent deposit for as many hundreds or thousands of chicks as you will need.

METHUEN, MASS.

Hatch with Electricity

Lectro-hatch

Electric Incubator Element

Convert your Old Incubator into a Modern Electric

Easily installed. Steady, even heat. Needs no watching. No fumes. More and better chicks.

Why worry along with the fuss, dirt and inferior results of an oil or coal incubator, when you can so easily and so cheaply convert it into a clean, modern, dependable electric machine?

It takes but a few moments to put the Lectro-hatch Electric Incubator Element into your old machine, and there you are—ready to hatch with electricity.

Think what it means to turn an electric button and let electricity hatch your chicks in an incubator that regulates its own heat and needs no watching.

Clean, Convenient and Always Dependable

The Lectro-hatch is so clean, simple and odorless that you can keep it anywhere in your home. It has no lamp to fill, no wick to trim, no smoke, no soot, no risk of fire or explosion. It automatically regulates its own heat and needs no attention whatever, except the turning of eggs when desired.

So far as temperature is concerned, you can go away and leave it for days at a time. When you come back, the weather may have changed, the room may be cold, but the temperature in your incubator will be just exactly what it was when you left it. You adjust the Lectro-hatch to any temperature you want and it maintains that same steady, even heat all the time, until you're ready to change it or shut it off.

Bigger Hatches of Healthier Chicks

Remember, with the Lectro-hatch, there is no smoke or poisonous gas to stunt or kill the chicks in the shell. Fresh, pure air circulates constantly. There are no cold corners, no ups and downs in the temperature. The largest, most successful poultry raisers in the United States will tell you, from experience, that day-old chicks from Lectro-hatch machines have the appearance of being one week

old. They are bigger, livelier, healthier in every way. And it is not uncommon to hatch 80 to 90 percent of the fertile eggs in the Lectro-hatch.

Easy to Install, and Even Easier to Operate

We send plain and complete instructions for converting your machine into an electric. You don't have to know a single thing about electricity to install the Lectro-hatch or to run the incubator. Bore a hole and drive a few tacks—that's all there is to installing it. Turn a thumb nut until the thermometer shows just the degree you want. After that, our patented Regutroller automatically holds that temperature for you, absolutely steady and even.

Lectro-hatch Elements are made to fit any size or style of machine. They attach to any electric light socket, and operate from any kind of electric current—from farm lighting plant, traction line or town lighting systems.

Costs Very Little

The cost of a Lectro-hatch Element is small, and the expense of operating it figures about the same as for a good grade of oil. But, oh, what an enormous difference in hatching results, in cleanliness, in ease, convenience, and peace of mind.

Hatch With Electricity This Year

If you are interested in electric hatching, write us at once. We can supply either the element to convert your old machines or complete new Electric Incubators and Brooders. The same wonderful principles are in both—steady, even, dependable heat; no worry, no work, no watching, no smoke, no gas, and absolute assurance of bigger hatches and better, healthier chicks.

Read What Leading Poultry Raisers Say About It.

Will Increase Lectro-hatch Capacity and Eventually Use Nothing Else.

"We are glad to say that the electric heating system installed in our Mammoth Incubators was entirely satisfactory, the percent of hatch being very much increased and the chicks large and strong. We hope to be able to increase our Lectro-hatch capacity each year and eventually use nothing else."—PORTERFIELD HATCHERY, Richmond, Indiana.

U. R. Fishel, World's Leading White Rock Breeder, says:

"We are the first to use exclusively in our Mammoth Hatchery of 18,000 capacity, the wonder element, ELECTRICITY. Not only does this method of incubation hatch stronger chicks, but it hatches larger ones. They really look like week-old chicks as hatched by the old method of incubation." (Note: Mr. Fishel uses Lectro-hatch.)—U. R. FISHEL, Fishelton Farms, Hope, Ind.

Large Commercial Hatchery Pleased with Lectro-hatch.

"The two machines we fitted with your Electric Element are working splendidly. The absolute safety in their operation, with the better hatched chicks and the elimination of all worry over regulation of temperature, regardless of weather changes, brings to the hatcher as near a perfect incubation device as seems possible. We hope shortly to install more machines fitted with your appliance."—SNOWFLAKE HATCHERY, Indianapolis, Ind.

Judge Walter C. Young, A. P. A. Judge, Supt. Moraine Farm, Dayton, O., says:

"Never have I operated a machine that holds such an even temperature, all through the hatch, as the Lectro-hatch. And the most pleasing feature of all is the size, weight and vigor of the chicks as they come out. Last year we hatched 75 percent of all fertile eggs left in the machine. One hatch in particular we brought out 83 chicks from 85 eggs."—WALTER C. YOUNG, Supt. Moraine Farm, Dayton, Ohio.

Investigate electric hatching—the most wonderful development in the poultry industry. Write to-day for complete information.

Electric Controller Co., 410 E. 10th St., Indianapolis, Ind.

in the incubator, and this can be measured, if desired, by means of a hygrometer, which can be obtained from any good poultry supply house.

Having our machine located in a place where it can be run under good conditions, we would say that the next important factor and probably the most important, is the egg to be hatched. Hatching eggs should come from stock of known vitality, reared under ideal conditions and not forced for egg production. This is absolutely essential, and if the hatching eggs are to be bought, it is very important that they be obtained from some reliable breeder, of which there are many advertising in this journal. The same warning applies here as to the purchase of the incubator: do not buy any cheap eggs or you will regret it. If the eggs are to be held for hatching, keep them in a moist, not damp, atmosphere at a temperature of about 50 degrees F. and turn them occasionally. Do not keep over two weeks. If the machine is ready when the eggs arrive from a distance, do not set them immediately, but hold them for at least twenty-four hours; this will give the various parts of the egg time

to settle down after being shaken on their journey.

An incubator should always be run empty at a temperature of 103 degrees for at least forty-eight hours before placing the eggs in the machine in order to thoroughly warm up, and also regulate the thermostat, especially when first used for the season.

As regards temperature during the hatch, some makers advise 103 degrees from start to finish, and others 102 degrees first week, 103 degrees second week, and 104 degrees third week. I have never found any appreciable difference in the hatch with either of these methods. Perhaps the easier way for an amateur is to run the machine at 103 degrees all through, and splendid results can be obtained by this method. Do not be alarmed if the temperature should go a degree or so higher or lower for a few hours, an immediate adjustment of the thermostat will take care of this, and no appreciable harm will result to the hatch.

Turning the eggs is one of the most important factors in incubation, and it is absolutely necessary that this be done regularly in order to prevent the

germ from sticking to the shell. Beginning on the morning of the third day the eggs should be turned every twelve hours until the night of the eighteenth day, when the machine should be closed, and under no circumstances opened again until the chicks are taken out. It is a very simple matter to turn each egg completely by taking out a few from the center of the tray and shuffling the rest around with both hands, then putting back the eggs just taken out along the sides of the tray. By this means every egg can be turned.

Cooling has come to be regarded as one of the least important factors in incubation, and there are very divided opinions as to whether cooling is necessary or not. In fact many experimental stations have proved to their satisfaction that cooling is not necessary. However, I venture the opinion that a moderate amount of cooling is very helpful and increases the resulting vitality of the chick. Beginning with the seventh day and continuing until the eighteenth day, it will be found advantageous after the morning turning until an egg feels cool when applied to the eyelids. Toward the end of the hatch

MARCY FARMS P. O. Box M MATAWAN, NEW JERSEY

it will found that the eggs can be left out to cool for a much longer period of time, as the embryo begins to give off heat of itself. It is usually best to apply methods corresponding as closely as possible to natural incubation, and we find that a hen, when left to herself, will generally leave the eggs for quite a long time, especially toward the end of the hatch.

There are several more factors which are considered vital to the success of the hatch, one of which is sanitation. Many an operator has splendid success with his first hatch, and possibly with the second, but subsequent hatches have resulted in failure, simply owing to lack of sanitary precautions. After each hatch, and before any more eggs are put in the machine, all the removable part such as egg trays, sand trays, etc., should be taken out and thoroughly washed with warm water and soap; the inside should then be thoroughly washed and the trays put back. When the whole interior of the machine should be sprayed with a weak solution of some good disinfectant.

Great care should also be taken with the lamp. A new wick should be used

for every hatch, as it is absolutely necessary that there be no danger of having wicks too short at any time during the hatch. The lamp should be cleaned very thoroughly at this time, and one of the best way of doing this is to boil the lamp burner in a solution of washing soda.

Many operators have trouble in trimming the wick of the lamp, so that it does not smoke when the maximum amount of flame is desired. A good way to do this is to cut it straight across with a pair of scissors, then round off the corners very slightly, but not too much, as a pointed flame is very undesirable. It need not be trimmed with scissors again during the hatch, as the only care it needs then is to have the charred portion scraped off with a match or knife every night and morning. Fill the lamp once a day, preferably in the morning, after the eggs are turned. This will prevent any oil getting on the eggs from the hands, as kerosene is fatal to the embryo.

When handling Leghorn eggs, I have always tested them on the fourth or fifth day, in order to remove the clear eggs and dead germs as soon as possi-

ble. These clear eggs can be used in cooking, sold to confectioners, or boiled and fed to chicks, and will be found to be very little affected by this time. Dead germs are of course disposed of in other ways. The eggs are again tested on the fourteenth day when all dead germs are removed. Brown eggs cannot be tested quite so soon as white eggs, but it is wise to test just as soon as embryo can be seen.

I have always much sympathy for the amateur, who cannot leave the machine alone at hatching time, especially if the chicks are panting a little and seem distressed. It seems the most natural thing in the world to open the door and let them have some more air, but this is fatal to the hatch. If the temperature and the conditions are right there is no need to open the door after the eighteenth day, and it is very injurious to do so. A good plan is to hang a cloth in front of the incubator at hatching time. This will prevent a lot of undesirable crowding to the light on the part of the chicks, and also prevent the start of toe picking and beak picking among them.

WHY TAKE CHANCES?

Find Out What an Incubator is Made of Before You Buy

Send for Our **FREE Catalog** and We Will Send Sample of Material Used in Our Incubators and Brooders

Then you will know which machines are built best, which will last longest and which will give you the most value for your money. Year after year these unbeatable Wisconsin's have proved their superiority over all other machines, regardless of price. Below are a few of the record-breaking hatches taken off by owners of this famous Wisconsin outfit.

Wisconsin Incubators Have Double Walls

It pays to investigate before you buy. For example: Wisconsin Incubators have double walls—the outer wall is of California Redwood and the inner wall is of insulating board with dead air space between the walls. Hot water heat—double glass doors—**COPPER TANKS**—self-regulating. Roomy nursery under egg tray. Incubator is finished in its natural color, showing the high grade California Redwood lumber used—not painted to cover up inferior material. Both machines shipped complete with thermometers, lamps, egg tester and book of directions; **all set up ready for use** when you get them. Freight paid east of the Rockies.

You Take No Risk!

I have been advertising in this paper for years. The publishers know me and know I do just as I agree. One good hatch will pay for a Wisconsin outfit and more. Send in your order direct from this advertisement or write today for our free catalog. Address

centage of chicks hatched from total eggs set, also the percentage of fertile eggs hatched. Although we read various accounts, mostly in testimonials to makers of very cheap machines, of 95 percent and even 100 percent hatches, such things are very, very rare; I confess I have never seen one, nor had the pleasure of meeting anyone who performed this feat. A hatch of 75 percent of total eggs set and 85 percent of fertile eggs hatched, is very good and about the best we can expect. The average is about 60 percent total eggs hatched, and 75 percent fertile eggs. There have been many theories to account for the large number of chicks which die in the shell during the last day or so of artificial incubation. Undoubtedly the cause in most cases is directly attributable to the lack of vitality in the parent stock, but not always so. I have set eggs under hens and in incubators from identically the same pen of birds, produced under same conditions, and have had perfect hatches from the hens, and anywhere up to 30 percent dead chicks in the shell in the machines, and the machines have been run right. This proves that there is still something lacking to make the incubator an ideal hatcher, and experiments are constantly being made at the various experimental stations to determine the cause. However the incubators are so nearly perfect now that, as a means to save time and labor and cut down costs when handling large quantities of eggs, it is undoubtedly the finest invention poultrymen have had in recent years. The big, mammoth incubators are now so nearly mechanically perfect, that one man can attend to tens of thousands of eggs when he could only attend to hundreds under hens.

To sum up it is necessary to have the following factors in incubation, if good and consistent success is to be obtained:

- 1—A good incubator.
- 2—Suitable location for same.
- 3—The best hatching eggs that can be obtained from stock of known vitality.
- 4—Suitable provision for adding moisture to the air.
- 5—Consistent care in operation such as turning, cooling, testing, etc.
- 6—Perfect sanitation.

New Jersey. Ernest Craze.

POULTRY AS A HOBBY.

Second Prize Article.

I am not an experienced poultryman but I know enough to about chickens and have kept them to a great enough extent to know that a human interest in the birds and a love for the work is one absolute necessity if one is to get either pleasure or profit out of a venture in poultry. To regard the birds as only an incident in the business and a means to an end, spells failure and disgust, unless of course, one has an abundant supply of money that will plug up the holes made in the business by lack of proper interest in the birds.

I have been a lover of poultry all my life but my biggest venture in the business was as a back-lotter and I might say that I grew up with that venture because I built my poultry house myself and with as much care as one would build a home for himself. My wife and I hatched a flock of purebred White Leghorns, a la incubator, being rewarded with about a 75 percent hatch

and succeeding in raising about 55 percent of them to maturity. I really believe that we ate cockerels from that flock that would have held their own with many that I have seen win ribbons at the Cleveland, Ohio, and Pittsburgh, Pa., shows.

We got out first egg on Thanksgiving day of 1917, but did not start to keep a correct record until Jan. 1, 1918. we sold our eggs all from the front door of our home at from 75 cents to 90 cents per dozen and for the four months of January, February, March and April of 1918, we realized a net total profit of \$72.81 from the eggs of forty pullets and the sale and use of a few cockerels for table use only. We fed commercial scratch feed, costing us \$4.25 per 100 lbs. and all other feeds in proportion. We kept a good grade of dry mash before them at all times and in the extreme cold weather an occasional warm mash was given, fresh sprouted oats every day and we ground our own beef scraps and bone fresh from the butcher, this latter feed must be fed very carefully or it spells trouble, a plentiful supply of fresh water, oyster shell, grit and charcoal always on hand with an occasional cabbage hung up for them to jump at. About twice a week I would cut up a good big onion and give it to them, whether this did them any good or not, I cannot say for sure, but their lively chattering activities made me think that it did and was plenty of argument for me to continue and they were surely shelling out the eggs.

We had some canker and roup to contend with that winter because of mistakes in construction of the building, not sufficient ventilation, but all in all we were very well satisfied and so was the party who purchased the flock when a change in our life's plans made it necessary for us to sell our home and consequently give up the keeping of poultry temporarily, with emphasis on the temporarily, because we are ever looking forward to the time when we can get back into the fascinating health-giving business of keeping poultry and on a much larger scale, we hope.

It is not a hard matter for anyone who is long on mathematics and short on practical knowledge of poultry, to take these few figures of ours and work out a great money-making project by the simple form of multiplication, but there are many things that enter into the poultry business besides bookkeeping and most of them have to be learned by practical experience. Although our venture was entirely successful, we made many mistakes which will not be repeated because coupling our experience with the valuable instructive material that appears in our up-to-date poultry magazines every month, has well fortified us against making the same mistakes again and mathematics will never replace lack of human interest in your chickens.

If any prospective fancier cares for our little mite of advice on chicken keeping either as a hobby or a means of livelihood, we pass it along gladly. Do not waste your time and money on a bunch of mongrels, select the one breed that you like best and stick to it; raise none but purebred stock of Standard type; do not make mollywoodles of your birds, but in the matter of feeding, housing and cleanliness, apply the Golden Rule. They will reciprocate in a manner that will surprise you and last

Meat and Egg Production

No matter how well bred fowls may be, the production for meat and eggs will not be satisfactory unless they have the proper feed.

Proper feeding is more than just giving poultry the exact amount of certain feeds. To do this successfully you must assure yourself that you are receiving good sound feed. Feed that does not contain damaged samples, smut and other fungi. Many diseases are traced to fungus—contaminated grains. To avoid these troubles you should come to us, and we will give you pure, fresh

Basic Feeds

Hulled Oats
Steel Cut or
Pinhead Oats
and Feeding
Rolled Oats
are the best
of foods

Unsuitable food will not only impair the health of your stock and limit production, but will also seriously affect fertility and ruin the constitution of the progeny

Send your formula to us

Our business is furnishing basic feeds to poultry feeders. We grind and mix 90 tons a day. We have no by-products to get rid of—no trade name to sell—nothing but pure basic feeds. Every pound is genuine food sent direct to you from our mill.

Write and tell us what you are feeding and we will quote you prices that are governed by the quotations in the grain market, and when the prices go down you get the benefit. Could anything be fairer? Let us quote you on hulled or pinhead oats. We want you to know more about basic feeds as ground and sold by us. Let us send you our current price list, you can see what ground poultry meal is worth at mill prices.

but not least, cultivate a genuine affection for the birds and the business, without it you can never succeed either in the back lot or on the farm.

Pennsylvania.

Fred Keightley.

Production of Hatching Eggs.

Hazards which sometimes accompany the incubation of eggs are largely avoidable. Fertile eggs from vigorous breeding stock are necessary in order to obtain good hatches.

Free range for the breeders is most desirable for the production of fertile eggs with vigorous germs, but all eggs produced from such hens should not be used for incubation. Eggs that are abnormally small and poorly shaped or those having thin or very poor shells should be eliminated. Dirty eggs or badly spoiled ones should not be used. If it is found necessary to set slightly soiled eggs they may be cleaned by rubbing lightly with a damp cloth, care being taken not to rub off any more of the natural bloom than is necessary.

It is never advisable to use for hatching eggs that are more than two weeks old. In freezing weather eggs should be collected two or three times a day so as to prevent their being chilled. Neither a hen nor an incubator will hatch strong chicks from eggs containing weak germs or from those which have not received proper care.

In preparing the nest for the sitting hen, it is recommended to put from three to four inches of damp earth or a piece of grass sod in the bottom of the nest before the nesting material is put in to provide moisture. When the hen becomes broody, and before she is transferred to the nest for sitting, she should be dusted with insect powder or sodium fluoride. In doing this hold the hen by the feet with the head down, working the powder well into the feathers. This should be repeated about the eighteenth day of incubation so as to be sure that there are no lice present when the chicks are hatched.

The hen should be moved at night from the regular laying nest into the nest where she is to be set. The latter nest should be in some out-of-the-way place where the hen will not be disturbed. In order to make sure that the hen will continue to stay in the new nest, she should be started with one or two china nest eggs. If, at the end of the second day, when the hen should be permitted to leave her nest for food and water, she returns in a short time, the nest eggs may be replaced with the eggs that are to be incubated.

Throughout the period of incubation the eggs and nests should be kept clean. Sometimes it will be necessary to change the nesting material. Eggs should be tested twice during the incubation period, preferably on the seventh and fourteenth days, and all infertile eggs and those with dead germs should be removed. When the eggs begin to hatch, the hen should be confined and not disturbed until the hatching is complete. If she becomes restless remove the chicks as they are hatched and keep them in a warm place until the hatch is complete, when all should be returned to the mother hen.

Copies of a bulletin on "Hatching Eggs" may be had free by writing the United States Department of Agriculture, Washington, D. C., and asking for a copy of Farmers' Bulletin No. 1106.

Heart of America Poultry Show.

(Continued from page 17.)

right kind of a frame on, they are entitled to special mention in this journal, and we hope to see more of this class of exhibits at all of our big shows, not only this year but for all years to come.

THE WEST SEES SOME WHITE WYANDOTTE MODELS.

In White Wyandottes, John S. Martin, of Canada, had thirty-two entries in the open class and won a ribbon on every entry, winning all firsts and seconds, including old and young pen. We doubt if Mr. Martin ever has put on a better exhibit at any time or place. In looking over his exhibit, the first and fourth cockerels in the open class and the cockerel at the head of second young pen, were decidedly above the average. When I refer to these specimens and mention a winner below first, please do not infer that I am criticizing the awards of the judge, as no one but the judge handles the birds in all sections and knows fully why he places them as he does; but the specimens to which I refer were birds that filled your eye, and you always found them in that pose, no matter when you looked at them.

The word "strain" as used by many breeders means nothing, but the word "strain" as used by Martin means a lot. A man can advertise a strain simply because he owns a certain line of birds, and at the same time the birds may not possess any strain characteristics that distinguish them from any other strain; but this is not true of the Regals. I venture the assertion that I can pick out a Martin female, no matter where or by whom exhibited, nine times out of ten, because he has bred into his strain of White Wyandottes a head and comb that are so nearly perfect that, even under the score-card system of judging, but few of them would be discounted more than one-half point. The comb has the right width in front and gradually tapers to the rear spike. It is high enough on the head, without being lumpy, or without having coarse serrations; in fact, he has produced a comb that an English fancier would say was "finished," and while this feature is a characteristic in all his birds, it was especially marked in his females and in his first and second young pens. In these birds the combs were identically alike, and in breeding this into his strain he has developed a perfect Wyandotte head that is made up of a broad skull, clear bright eyes, well developed wattles—in fact, a head that shows true Wyandotte character. With such a strain one can depend upon it that he will produce winning specimens in large numbers.

The White Leghorn class, while not as large as I had hoped to see, was really representative in high class specimens. The first and second cockerels were outstanding winners and birds that would be considered for a place in any show, no matter how many might be against them. If there is any criticism to offer here it would only be offered in the matter of the conditioning of the birds and the attention the owners should give to the cages when white birds are placed in them. When birds are to remain on exhibition for a week and have been washed and laundered until they are as white as soap and water will make them, then it is essential, in fact it is the duty of the owners to see to it that cages are washed and wiped perfectly dry before such specimens are placed in them. The first cockerel at Kansas City, after turning around many times in the cage, had his sickles and main tail feathers against the cage until they were soiled; and a blemish of this kind detracts from the looks of really fine show specimens.

BROWN LEGHORN AND WHITE ORPINGTON CLUB MEETS FAIL TO BRING OUT BIG CLASSES.

The Buff Orpington class was perhaps as good in quality as we will find at any of our early shows, as they were fitted by Maurice Delano and they were fitted for competition, and to those who know Maurice Delano it isn't necessary to go any further into detail.

White Orpingtons, a small entry, although a national club meeting. Honors were divided between Gensel, Haynes, Friend and R. E. Sandy.

The Brown Leghorn class, although a national club meet, was not nearly as large as we had expected, but there were some exceptionally good birds among them; males that showed the right length of leg, with good carriage and fine striping in neck and saddle; while the stippling of the females in the Light Brown Leghorns, together with good striping in neck, was all that could be desired.

Silver Wyandottes, an attractive show; some very good ones, especially in females, first and second hen and first and second pullet being decidedly above the average.

The Bantam show was quite a feature of

A. A. Ziemer, Box 84, Austin, Minn.

IMPORTANT

I have discontinued the selling of hatching eggs and in future will sell only matured birds for exhibition purposes or breeding stock. At the coming Madison Square Garden Show, January 18 to 22, 1921, I will have in competition a large string of Orpingtons, Buff, Black and White. Every solitary specimen will be a Robadel line-bred bird. Think it over!

In view of the fact that I will no longer sell hatching eggs, my flocks in all three varieties will be reduced materially, reserving only enough birds for my own breeding purposes. Bear in mind, these birds have won in Madison Square Garden as follows: **Whites**, the last two years, Best Display; **Blacks**, Best Display last year; **Bufs**, Second Pullet, Fifth Cockerel, Fourth and Fifth Old Pen last year. If you are interested in Orpingtons, our birds are well worth your investigation.

All sales are positively guaranteed.

PARTIAL LIST OF CONTENTS

American Poultry Industry: Origin of domestic fowls, magnitude of the industry, tables showing the numbers and kinds of fowls raised in different states, export trade, average prices on poultry and eggs in leading markets for past twenty years. **Analysis of Standard Breeds:** Description of each variety, not alone from the fancier's standpoint but according to utility qualifications, including sixty pen drawings of ideal types by a leading poultry artist. **Companions of the Hen:** Special chapters on ducks, geese, turkeys, guinea fowls, and pigeons, care and feeding, market value. **Incubation and Brooding:** Natural and artificial methods, how to choose equipment, incubator management, selection of hatching eggs, fertility, baby chick industry, sitting hens, testing eggs, how to build incubator cellars and brooder houses. **Poultry House Construction:** Designs for all kinds of buildings, laying houses, colony houses, brood coops, curtain-front and open-front houses, interior fixtures, nests, perches, watering systems, labor-saving devices. **Feeding:** Analysis of foodstuffs of every description, how to compound rations for poultry of all ages and for all purposes, formulas recommended by leading authorities, feed hoppers, mixers, carriers, methods of distribution, records, storage-bins, costs, forced feeding, fattening, sprouting oats. **Diseases:** Symptoms and causes of all common ailments, remedies, with special references to white diarrhea, worms, and vermin, how to make disinfectants and dusting powders. Five chapters are devoted to the treatment of diseases. This is a treatise in itself. **Breeding:** Management of stock for increased egg production, selecting males, trapezing, hybrids, pelvico-bone tests, prepotency, capacities of hens, pedigree breeding, marking fowls. **Management:** Advertising, selling methods, marketing, caponizing, by-products of the poultry flock, including the preservation and uses of manure, feathers, and so on; shipping instructions, preparing birds for exhibitions, preserving eggs, killing and dressing poultry, practical study of the formation of eggs, embryology, measures that prevent mortality among chicks, broiler raising, importance of good business methods. **Equipment:** Working plans and instructions on how to make all kinds of poultry appliances, self-rising doors, ventilators, catching coops, broody hen boxes, trapezoids, fattening pens, egg candlers, feed hoppers, erecting poultry netting, racks for sprouting oats, hatching egg cabinets, electric egg tester, outdoor incubator, colony brooders, feeding frames, etc. **Commercial Poultry Raising**, in fact, is an encyclopedia brought right down to date. A copy should be in the hands of everyone who wants to make a profit from hens.

Price \$3.00, Postpaid

the Heart of America exhibition, but not enough birds to make competition strong in any of the classes. However, the winning specimens in the Black Cochins, especially in hens, as good as will be shown anywhere this winter.

The rabbit and pigeon shows, as I understand it, are held by different organizations and under different managements, but they called out a nice entry and many good specimens were shown. The rabbits and cavies have really become a part of the poultry entry. Nearly all national shows are recognizing them and we really believe they should have a place as prominent as that of the prominent breeds of poultry, as they have a commercial as well as a fancy value.

The pigeon breeders, on account of the light weight of their birds, can arrange to take the elevation, as their birds show to just as good advantage and the boxes, as a rule, are light. The pigeon fanciers are perhaps the most clannish of any class; they like to be together, but they like to be alone, so far as other breeders are concerned. If you set a row of pigeons down in the poultry show, the pigeon fancier is lost. This is not said with any disrespect to any of the pigeon fanciers, because there is not a class of breeders that are truer fanciers than the pigeon men; but they are for pigeons first last and all the time, and they can chew the rag longer and have more fun out of their little game than any set of men we know of.

Another class that we were about to overlook is the Bronze turkeys. Kansas City for the last thirty years has been noted for its turkeys, and this year was no exception. While I have seen larger entries in some of the old shows that were held in the upper floor of the Convention Hall, I do not know that I have seen any better quality than was shown this year, especially in the females, and regardless of the early date they were in full plumage and several of the pullets were over Standard weight.

THE ANNUAL BANQUET.

The annual banquet, as usual, was one of the features of the show. This was held on Wednesday night at the Coates House and there were about seventy-five persons at the spread, with W. W. Henderson acting as toastmaster. The judge is good anywhere you put him, but he's especially good as a toastmaster at a banquet, for he knows everyone and calls them by their given names. The young man that entertained the A. P. A. convention at Kansas City in August was on hand with his list of songs and he made you sing whether you wanted to or not, but he capped the climax when he brought Reese Hicks, Hank Schwab, Maurice Delano, Johnny Martin and H. V. Tormohlen on the floor and made them sing a "solo." The reason we call it a solo is because some of them were so low that we never heard them.

The attendance the first two days was hardly up to the expectations of the management, but the newspapers were giving them good mentions and we trust the last four days more than overbalanced the poor attendance at the start, as weather conditions were good and the show was certainly entitled to the patronage of the best people of Kansas City.

LIST OF AWARDS.

S. C. Rhode Island Reds—Mountain View Farms, Edgewater, Colo., 5 cock, 2 hen, 2-3-5 ckl, 3-4 pl, 1-2-4 old pen; Hurstbourne Farms, St. Matthews, Ky., 1 cock, 3 hen, 4 ckl, 1 pl, 3 old pen, 1 young pen; Elmer F. Benson, Whitman, Mass., 3 cock, 1 ckl, 5 pl; C. R. Baker, Abilene, Kan., 4 cock, 4 hen; F. M. Osborne, Jr., Willoughby, O., 2 cock, 5 hen, 5 young pen; E. H. Rucker, Ottumwa, Ia., 1 hen; P. E. Hewitt, Muskogee, Okla., 2 pl; J. M. Clark, Kansas City, Mo., 5 old pen, 4 young pen; Owen Farms, Vineyard Haven, Mass., 2-3 young pen.

Brood Your Chicks

30 Days FREE

Simplex
Brooder
Stove

Use the new 1921 Simplex Brooder Stove on your own hatch for thirty days free. Raise 20 to 50 per cent more chicks at 1-5 the cost, 1-10 the work and 1-4 the operating expense. Small and large broods. Three sizes of stoves. Try our stove under all conditions and if you are not delighted send it back and we will cheerfully refund your money.

Turn Losses Into Profits

This wonderful brooder will raise 50 per cent more of your chicks than you have been able to raise under the old fashion methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by the extra money it makes for you. The Simplex Brooder Stove burns kerosene oil, natural or manufactured gas, automatically regulated to insure an even temperature with the least possible attention.

Free Brooder Book

Write today for valuable free brooder book and catalog. It tells how to "increase your profits by decreasing mortality." Tells how to save chicks you have been losing each year through disease and faulty brooding. How to make more money. Also catalog and details of 30 days trial free. No obligations. Write now.

Boys Better Off in the Country.

Frank E. Hering, well known breeder of Silver Campines, is editor of the *Eagle Magazine*, and in a recent editorial, drew a truthful contrast between the city and the country as places for young men to live their lives. Mr. Hering said:

"The migration from the farm to the city is due mainly to three causes: First, the eight and nine-hour day of the city worker appeals strongly to the farmer boy, whose working day during much of the year is from twelve to fifteen hours, and whose working week is seven days where there is live stock to be cared for. Second, the city provides opportunities for recreation beyond those of the country—that is, the movies, the cafes, baseball, and many other indoor and outdoor recreations. Finally, the high wages paid skilled mechanics serve to entice the younger generation from farm life to city life.

"Now, what does the farmer boy leave behind? Hard work, to be sure, and long hours of labor, and uncertain returns. But he leaves something else behind, something that is almost the breath of life—his independence and importance as an individual. The farmer, by the nature of his occupation, is used to thinking out his own problems and planning and following out his own procedure. And he pursues an operation from its beginning to its end. For instance, he prepares the soil of his wheatfield, plants the seed, cultivates it, and harvests the crop. Labor-saving machinery is making his job easier, so far as the work itself is concerned, but it has not taken from his shoulders any of the responsibility, and it is this responsibility centered in one person or in a small group of persons equally interested that makes for mental independence and self-reliance.

"Again, the farmer lives in a house that is isolated from those of his neighbors. In addition to his orchard and fields he has a garden where much of the food that goes on his table is grown in season. Chickens, cows, and pigs thrive and produce on the 'waste.' Thus, the farmer is independent, also, of his neighbors and of the profiteering middlemen of the cities.

"When the farmer boy moves into the city he leaves all this behind. His hours are shorter, his wages are high and paid regularly, and the bright lights beguile him. But if he goes to work as he does by the thousands, in a textile mill, an automobile plant, a shoe factory, or any similar plant, he is assigned a place at a machine and his sole duty rests in superintending that inanimate device, which with wearisome monotony turns out, over and over, one small part of what will ultimately be an intricate and valuable commodity. He is not confronted as is the farmer every hour of the day with some problem in connection with his work that he alone must solve. Instead he is but one of a mass, directed from above, who do the same thing that he is doing, under the same conditions, and for the same compensation. There is no exercise in it of the sense of personal responsibility, no inspiration to resourcefulness. Could anything be more tiresome to an inquisitive mind and an aggressive nature than this? His problem is then, not how to suit varied efforts most productively to the season and to the markets, but how to keep this monotonous repetition of a single gesture or set of gestures from wrecking his health and mind. Operating hour by hour, day by day, week in and week out, a machine that turns out a standard thread on bolts of standard size, allows no play for his imagination; no opportunity for choice of methods; no striving uncertainty as to the result. In time the operator of such a machine becomes himself a machine, so far as his work is concerned.

"Moreover, the city worker is dependent on a chain of middlemen for every leaf of lettuce, every onion, every egg, and every pound of bacon that he buys. To the problem of warding off the deadly fatigue and discouraging fraction of a process, and of the high cost of liv-

Paramount breeding

THE years that we have spent in mating and breeding birds to win at exhibitions and egg-laying contests and the tremendous wins gained we are justified in saying our breeding is paramount.

1920 Chicago Coliseum Winnings

1st and 2nd Old Pen

1st and 4th Young Pen

2nd, 3rd, 4th, 5th Cockerels

1st, 4th and 5th Hen

1st, 2nd and 3rd Pullet

Largest and Best Display

These winnings were made in competition in one of the strongest class of White Leghorns ever exhibited. We won 106 points—nearest competitor won but 28 points. Our total points showed that we gained one point more than all the other exhibitors combined.

Hillview Single Comb White Leghorns

will win for you. This we have proven by our own spectacular wins at the 1920 Chicago Coliseum show, as well as the 1919 Coliseum show. When it comes to birds for egg-production look over our list of winnings at the famous laying contests—they are convincing.

You are not taking a chance when you purchase Hillview birds. Every single bird, mated trios and breeding pens are sold under a guarantee to give the purchaser positive and complete satisfaction.

500 Cockerels

These are husky young fellows we are anxious to place in hands of breeders who appreciate true breeding qualities.

Hatching Eggs Baby Chicks

Our eggs run very high in fertility, averaging 90%. Book your orders for hatching eggs and baby chicks now, to insure prompt delivery.

Layers? Look at This!

In Missouri Egg Laying Contest, HILLVIEW one third highest honor in Leghorn Class. This pen of five birds, hatched June 26th, 1919, made the following individual record: 221, 208, 233, 196, 238; Total 1096.

Other Egg Laying Winnings Individual Official Records

257, 248, 263, 217, 248, 257, 251, 202, 230, 243, 240, 246, 267. 1st prize pen Missouri Egg Laying Contest, 1918. 1st prize yearling hen pen American Egg Laying Contest, 1918.

SUCCESS

SUCCESS in poultry raising demands *uniform hatches* of the highest quality chicks that will mature quickly, *without loss*, under the right brooding conditions.

BUCKEYE
THE PERFECT INCUBATOR

That is just why Buckeye Incubators and Brooders are recognized as leaders.

Week in and week out, the Buckeye Incubator hatches more chicks—sturdier, larger and more vigorous chicks. Because of its scientific design and careful construction, it is unequalled as a hatching machine, and is preferred always by the men who know.

And, in justification of their faith, it never fails to turn out the largest possible number of chicks--chicks that, for size, vigor and vitality, cannot be excelled.

Literally, it has taken all the gamble from the hatching of chicks and turned disappointment into success.

Ask the
Buckeye

H. CECIL SHEPPARD'S BROODER HOUSE, BEREA, OHIO

POULTRY-

HATCHING chicks is only the *first step*. They must be brooded through *babyhood to maturity*. Here also the Buckeye equipment leads in every respect.

BUCKEYE
COLONY BROODERS

The Buckeye Coal Burning Brooder has revolutionized the chick industry, because it has literally "made three chicks grow where one grew before" with the least amount of attention and labor.

It is self feeding, self regulating, simple, safe and everlasting. Sold under a thirty-day money back guarantee.

The Buckeye Blue-Flame Oil Burning Brooder, for use where hard coal cannot be obtained, meets the needs of the quantity raiser as well as the small fancier, with the same standard of excellence maintained, while Buckeye Lamp-Heated Brooders are the premiers for small lots.

Wherever chicken raisers get together, whether they be famous fanciers, farmers or baby chick hatchers, Buckeye poultry raising equipment is universally acknowledged to be the most successful.

More than thirty years of success make the unqualified Buckeye guarantees as good as a gold bond. See the dealer and study this line, or write to us for descriptive catalogs.

Producing Best in Partridge Color.

(Continued from page 19)

way write a standard of color, after my ideas, but simply endeavored to give my conception of how to produce colors that we desire, hoping that in so doing it may be of help to you in preparing what you have in mind."

—G. W. M.

Now what do I suggest as a remedy for the present color troubles? First of all, define the color of the male. What is bright red and what is cherry red? Why not one even shade of bright red from head to tail on the back of the male? Have but the one even shade of red for neck and top color of back. Have it bright and clean and clear and even. The neck and saddle striped with brilliant black that conforms to the shape of the feathers, the stripe in each feather to be entirely and completely surrounded with red so that no black points will show at the end of the feathers. That which is most needed is an even shade of red with the proper amount of black and slate under color. Do not be so positive as to color of shanks and toes. Be satisfied with yellow for shanks and toes of the males.

As to the female, get rid of the black penciling. Have it distinctly penciled with modified black or brown and work gradually towards a combination of brown that will bring out a beautiful shade of mahogany, penciled with a darker shade. This can be accomplished and by following this rule you can have your Wyandottes and Plymouth Rocks as beautiful as the Mitchell Cochins, and you can breed them by single matings.

I wrote this same way from 1898 to 1904 and they said I was wrong, but with the success attained by Mr. Mitchell, I too, have been vindicated. I wrote at the same time that Barred Plymouth Rocks could be bred in the same way and today my good friend, Ed. Thompson, is very near to it with his world renowned Ringlets.

THE DARK BRAHMA.

The Dark Brahma is one of the oldest varieties of chickens in this country, and after having bred them for the last 27 years, I find them one of the best general purpose fowls on earth. The Dark Brahma hens are extra good layers of large brown eggs. For a first class table fowl they cannot be beaten. The hens are the best of setters, the kindest of mothers.

The chicks are hardy from the time they are out of the shell until full grown. With ordinary care you will not lose any. If you will feed them well and keep them growing, there is no variety which will show a more rapid growth.

The Dark Brahmas are easily fitted for the show room. They can be kept anywhere with a 2-foot fence, and under all conditions they always look well.

The males have that majestic carriage characteristic of all Brahmas. Head is silvery white in color and with small pea combs; beautifully marked hackle, with a pronounced black stripe in the center and a white edging on each feather.

The back is of medium length and the coloring is white. The breast is solid black, or slightly mottled with white. The males with mottled breasts

BLACK LAM

THE BI

M. S. BARKER R. F. D

30 DAYS' FREE TRIAL

are especially valuable to breed from to obtain nice, even penciled pullets.

The male's tail should be solid black, with short flowing sickle feathers, the lesser sickles having an even white edging like the saddle feathers. There should be a beautiful solid black bar across each wing.

The female should present a pure steel gray head, with neck the same as that of the male, but the back and breast coloring should be steel gray, penciled with black. The lines of the penciling should follow the contour of the entire feather. Therefore, in breeding for color, it is not necessary to always have a male with a solid black breast. One with an evenly mottled breast will have a cleaner colored hackle and back, and is more likely to be free from brassiness.

As in all other breeds, we must look to the females to give us the best offspring. In breeding them we have always found it advisable to use females of large size and males of medium size, which is preferable to males of large size and females of medium size.

That this grand old meritorious variety is not more widely bred is due to the fact that their good qualities are not well known. Their beauty is universally acknowledged to be the most striking of all breeds. Anyone getting Dark Brahmas of an up-to-date strain and giving them the intelligent attention needed to achieve success with any other variety, will have no cause to look for a better all-round chicken.

The future success of the Dark Brahmas is in the hands of those who breed them. Therefore, the Dark Brahma breeders should not fail to give them the prominence they so richly deserve. I can assure you the quality is in them, but needs to be made known. This is the honest advice of one who has bred them for the last 47 years and knows whereof he speaks.

Missouri. W. B. McCoy, M.D.

Factors That Govern Production.

My friend, John H. Robinson, has been writing in the Reliable Poultry Journal on: "What Is Possible in High Egg Production?" in which, as I think has been mentioned previously, he expresses the view that it might be possible to develop some of the present families of fowls until individuals laid 400 and on to 500 eggs per annum. Whether that is within the range of possibility or not does not now concern us. Two quotations are worth reproduction, and without comment, namely:

"In general the breeders who make reputations for strains of high producers get a larger proportion of high individual records in the earlier years of their work than when the stock has grown to proportions that make it impossible to give the attention to individual birds that they did in the beginning. It will usually be found that the highest records with a strain are not made by the originator who is now working with it on a large scale, but by some of his customers who have small flocks to which they give very close attention—people who can give the small flock or the individual hen any and every attention that will increase egg production, regardless of the cost of extra labor or extra food. With those who do this, working for extreme high production is a fad—a very capable one, capable of being used greatly to the benefit of poultry interests, but still a fad." And

"Of late years those interested in high egg production have worked mostly with the idea that degrees of fecundity are regularly inherited, and that breed, strain, family or line is the prime thing in securing high egg production. Nearly all hens respond to individual attention from persons in whom they have confidence. From an economic point of view it is wise to reduce the work with hens to the minimum, but for the utmost in egg production it is necessary to fuss with the hens to any extent that they appear to like." —Edward Brown, Feathered World, London.

Royal White Wyandottes

The results of 15 years of constructive breeding

No hen that has not produced over 200 eggs per year is used in my breeding pens. They are mated to tested cock birds.

For fifteen years I have bred Standard White Wyandottes for great egg production. By careful trapnest records and matings I have been able to increase egg production each year until now I feel I can say without fear of successful contradiction that I have the greatest laying flock of White Wyandottes in America.

Pens, Cockerels, Pullets, Cocks and Yearling Hens

from my best pedigreed, trapnested layers, with egg records in pullet year up to 293, are offered at reasonable prices. Cockerels from my great tested cock birds are in this offering for your foundation stock. All stock is farm range, vigorous and hardy.

EGGS FOR HATCHING Book Your Orders Now

THE WHY AND HOW OF WINTER EGGS.

By OTTO E. HACKMAN.

When the mercury in the thermometer gets intimate with the zero mark and the price of fresh eggs threatens to reach a dollar per dozen, daily egg yield becomes an interesting subject. Bringing in the precious ovals in the dead of winter, when one's neighboring poultry raisers' hens are on strike, and others are buying eggs for home consumption, is a source of pride and pleasure.

Now, as to the why and wherefore of these winter eggs that some seem to find no difficulty in obtaining, and which others find impossible to produce: really, there is no magic about it, no mystery connected with it. To sum the thing up in a nutshell, it is simply this: mature pullets of a bred-to-lay strain and proper housing and sensible management—that is all.

No out of the ordinary hens are required. Just simply good mature pullets and good feeding of the ordinary grains and mash, with the necessary exercise and proper housing; this is all that is necessary. With a flock of mature pullets in the fall, our hopes of solving the egg question may very well be realized, but with the absence of

these most necessary producers, our hoping and dreaming go for naught.

Pullets Better Than Hens.

Hens, even though yearlings, will not produce a creditable winter egg yield, no matter how well cared for or how well they have been bred for egg production. There must be a cessation in egg production during molt and for a time thereafter, to enable the hens to recuperate from its resultant debilitating influence. Therefore, hens cannot be expected to lay immediately after the molt, and we cannot rely upon them to produce, at least not during the fore part of winter. The early hatched pullets are the early winter standbys. Early hatching should, therefore, be the rule of the day. With perfected incubating and stove brooding systems there is everything in favor of early hatching, and it can be carried on successfully.

Now as to housing. The poultry house must be well ventilated—of that there is no question. And it must not be overcrowded. To keep a large number of hens in a house so crowded that they will be constantly quarreling and fighting with one another and without the necessary amount of floor space and roosting room, is a false sense of economy. There is nothing saved by adopt-

ing this method. It not only results in a minimum egg yield but offers a breeding place for disease. The fowls must have room to scratch and work in the litter without constantly stepping over each other or picking at one another. And there must be enough roosting room so that they may rest in comfort during the night. Many a bird has had its wings forced all out of position by being wedged together tightly on the roost. This forces the wings up against the back, a position only too readily assumed.

Ventilation in the Poultry House.

The house must have ventilation ample enough to keep the interior dry. There must be no frost coated walls. Such a condition in the poultry house is caused by the excess vapor that the birds give off during the night, becoming frozen on the walls. Were the interior properly ventilated, the atmosphere would be dry and not vapor laden, and as a result there would be no frost coated walls each morning. And cold, damp air is far more disagreeable than dry, cold air. Moreover, a chicken has a higher body temperature than man and does not feel dry cold readily. They can stand a low temperature comfortably if the air is dry, but if the air be

Only \$9.00

For this all metal CYCLE Hatcher — a simple, practical, safe and efficient 50-egg size incubator, complete, ready to use.

Metal construction; never warps, swells, shrinks, or cracks. Long burning safety lamp runs two to three weeks with one filling; automatic regulation; perfect heating system that does not dry out the eggs and insures normally developed, sturdy chicks.

The size is just right for the average poultry keeper, farmer or city lot poultryman. Two or three Cycles cost less than one large machine if larger capacity is needed.

Price, only \$9.00 complete. Can be sent by parcel post. Shipping weight 16 lbs. Postage extra.

What Others Say

Moweaqua, Ill., Feb. 16, 1920.
Gentlemen—I have used the Cycle Hatcher for nine years and can sure recommend them, as I have hatched as high as 47 from 50 eggs.
Yours truly,
James W. Smith.

Gladwater, Tex., Feb. 19, 1920.
Gentlemen—I have used your Cycle incubator seven years. Have better hatches than with any other machine I've used, and I have used several.
Respectfully,
J. G. Cox.

R. 3, Fairmont, Ind., Mar. 1, 1920.
Gentlemen—My mother has used one of your small Hatcher for years and likes it fine. Please send me your catalog.
Respectfully,
Mrs. Chas. P. Kibbey.

Combined \$11 Brooder-Hatcher

All-metal Hatcher and Brooder combined in one machine. One lamp serves both purposes. This is the most popular machine ever built for the small flock poultry keeper. Only \$11 complete. Weight for parcel post shipment, 18 lbs. Postage extra.

Hatch Your Own Baby Chicks

Hatching your own chicks in the all metal Cycle Hatcher or Brooder-Hatchers is simple, interesting and profitable. You can produce chicks at a total cost of from six to ten cents each, including cost of eggs—and the time required is less than that necessary to care for a setting hen.

No part of the poultryman's work is more interesting than the hatching of the baby chicks. You will find both pleasure and profit hatching the **Cycle** way. It is the leading small hatcher because it will hatch every hatchable egg, producing more and better chicks—the kind that are easy to raise. With the **Cycle** you can hatch early at the most favorable growing season.

The Cycle Hatches in Nature's Way

Because it follows natural principles. These points found in the Cycle will appeal to you. They are vital to success. **FIRST:** The heated air is applied on **top** of the eggs only, as under the hen. **SECOND:** No direct air passes through the hatcher to carry off the natural moisture in the egg. **THIRD:** Being circular, with the lamp in the center, the radiation is equal throughout the machine. **FOURTH:** The heat is brought close to the eggs, with no waste of heated air space. **FIFTH:** The eggs are turned and cooled similar to nature's way. **STUDY** the hen and investigate the **CYCLE**. It will pay you!

Ready-Built Poultry Coops, Fireless Brooders and a Complete List of Supplies Designed for TOWN AND CITY POULTRY KEEPERS

Fireless Hovers that save three to five cents on the cost of raising each chick, as low as \$2 each for 50-chick size. Galvanized Metal Hovers at \$5 each. Outdoor Brooder Coops, with fireless hovers, at \$13.50.

Ready-Built Coops. These coops are complete in sections, made from selected white pine lumber, painted, and fitted with roosts, screens, feed and water dishes, etc. Carried in stock ready to ship, and can be set up in a few minutes time. Good 6-hen size laying coop for \$18.50 complete; our 12-hen size laying coop at \$30 is big value. Also several other styles.

Write for New Free Catalog. Explains our new methods of Hatching, Brooding and Raising Poultry. Contains many ideas you can use with profit in your own poultry yards. Sent free. Write today. A postal will do.

Cycle Hatcher Company, 218 Philo Building, Elmira, N. Y.

damp it is decidedly unsatisfactory. Hence, one should see to it that the ventilation is quite ample.

In feeding the fowls, it is not conducive to good results to merely throw down the feed three times a day and fill the water vessels once or twice. The fowls must be fed on time and given the proper amount of food. A feast one day and a famine the next will not produce the hoped-for results. Slipshod methods should not be practiced. The fowls soon get to know the time of feeding and are on the lookout when that time comes. So one should be methodical in caring for them. And, also, keep them busy. Make them exercise by working for their feed. Exercise is, in reality, one of the secrets of winter egg production.

Exercise prevents overfatness and promotes health, and none but healthy fowls are profit producers. Bad habits, such as feather plucking and egg eating, can often be attributed directly to lack of exercise on the part of the hens. A busy hen has neither time nor inclination to contract bad habits. Exercise can be provided in several ways. Deep litter, in which the grain is scattered, affords one of the best and simplest means of inducing exercise. Suspending heads of cabbage high enough off the floor to make the fowls jump is also a good plan of promoting exercise.

The Feeding Problem.

Of the whole grains I prefer corn, wheat and oats. The oats and wheat

are fed in about equal proportions, constituting the morning meal, and corn alone, all they will clean up, is given as the last feed of the day. This is thrown into the litter about an hour before dusk and forked under. Oats, if of the heavy variety, is a good food. But if it is of the light kind it is mostly hull and has little food value.

After dark a little wheat is scattered in the litter so the fowls can get busy as soon as it is light in the morning. A little later in the morning more wheat and oats is given. It is my aim to give less in the morning than they are capable of cleaning up, as I want to keep their appetites on edge so they will keep busy scratching for the hidden grains.

In regard to the mash feeding, one can adopt either the wet or dry method, or both. I believe the fowls are more comfortable and better satisfied if also given a moist, warm mash in addition to the dry mash during the cold months. The dry mash if, of course, kept before them at all times, and only as much moist mash is given as they will readily clean up in about ten minutes. A good laying mash is as follows: Bran, 25 pounds; cornmeal, 20 pounds; middlings, 20 pounds; alfalfa meal, 20 pounds; ground oats, 20 pounds; beef scraps, 20 pounds; gluten meal, 20 pounds, and salt, 1 pound. This should be mixed together thoroughly. If one has only a small flock it is just as well to buy the commercial brands of laying mash, and

there are several excellent ones on the market.

As cleanliness is essential to health, and health an absolute requisite for good egg production, we must keep the poultry house in a sanitary condition. The droppings boards must be cleaned often, and they can then be sprinkled with air-slacked lime to aid in purification and the prevention of disease. The floor and litter should be dry. The windows should be kept clean so the sunshine may enter—for sunlight is a wonderful germ destroyer. Some hens persist in using the nest boxes for roosting places, and this should be discouraged at once. If the nest boxes have become befouled they should be cleaned out and fresh nesting material should at once be placed therein.

F. D. Rogers in New Home.

Frank D. Rogers, well known White Leghorn breeder, was recently married, and Mr. and Mrs. Rogers have moved into their new home on the outskirts of Elgin, Ill. Mr. Rogers has five acres, partly wooded, in this place, and will be able to grow his Standard White Leghorns in larger numbers than heretofore. His success up to this time has been made on a back lot, and he reached the point where he was handicapped by limited ground. It takes time to breed quality and build a strain, but once that point is reached, land can be purchased quickly.

Exhibit of Oak Dale Farms at Coliseum Poultry Show, Chicago, Ill., December 1 to 6, 1920

The difference between the very best incubator and a poor one

is not great as measured in dollars. But in *results* it is frequently the difference between the success and failure of the poultry enterprise, between a big profit and heavy loss.

Money invested in a poor incubator is worse than lost. Pay the slight difference and secure the guaranteed machine that will insure your success—the

PRAIRIE STATE INCUBATOR

For nearly forty years, poultry authorities and experts have recognized the PRAIRIE STATE as being the most efficient and all-round satisfactory incubator. This leadership has been hard-won—gained and maintained only at the expense of tireless effort and the expenditure of a vast sum of money. But the result has been to make available for you—and for every other poultry keeper—an incubator that will hatch every egg that can be hatched by artificial means, that consistently hatches big, husky chicks that live, that can be successfully operated by anyone and anywhere, that will give years of service without requiring repairs. *You can neither ask nor get more.*

PRAIRIE STATE superiority is based on two things:—perfection of principle and design—highest character of materials and workmanship.

The design—*exclusively PRAIRIE STATE*—aims to provide exactly those conditions which turn fertile eggs into strong chicks and to reduce to lowest terms the labor and care of the operator. And the machine—regardless of outside conditions—*properly and automatically* controls temperature, ventilation and moisture within the egg-chamber. The operator merely has to attend to the lamp and turn the eggs. The machine does the rest!

The materials used in every part are the best obtainable for the purpose. Cypress—"the wood eternal"—for the cases, instead of cheap, easily-worked soft wood. Zinc and steel thermostats instead of the usual "wafers." Heavy metal heating systems. Strong but attractive hardware. And all put together in the most thorough manner by expert mechanics working in one of the finest and best-equipped factories in America.

We know how good the PRAIRIE STATE INCUBATOR really is. And our faith is shown in our guarantee—a guarantee that includes *number and quality* of chicks hatched and *ten years of service* without repairs. It's the broadest ever written.

Can you afford to "take a chance" this season? Isn't it better judgment to use the GUARANTEED PRAIRIE STATE INCUBATOR and be *sure* of success? Write for the complete catalog now. It's mailed free on request.

**PRAIRIE STATE
INCUBATOR CO.**

114 Main St. Homer City, Penn.

Utility In Standard Layers.

I am glad to see that you published my letter about the display coops at the New York show. I have read with interest the letters on the same subject, also the various discussions on the Leghorn Standard. I am breeding a colored variety of Leghorns. I have good exhibition stock, and they certainly are good layers. I am not in a position to trapnest at present, but I am getting very good results from my small flock.

There is one point in this discussion that I believe has not been brought up in any printed discussion of the subject that has come to my notice. Utility or commercial breeders state that the Leghorn Standard demands yellow legs in females, thereby penalizing production. In fact, I recently saw a report of a nationally known laying competition where this statement was emphasized. Now, I believe it is a pretty generally conceded fact that in the Leghorn heavy and continuous production bleaches the yellow color out of the legs. This yellow color comes from xanthophyll, which the birds get chiefly from green feed. Now, it is pretty generally conceded that to get good strong fertile eggs our breeding stock must

have a long rest during the winter, production being very light. It surely is safe to say that any bird good enough to win at a show of any size will be used as a breeder the next season. Therefore, does not the fact that a bird has yellow legs show that her owner has sense enough not to force his breeding stock for eggs all winter long? Even if the birds could be good breeders after being forced for eggs all winter, after laying even a short time a bird is not in show condition. Laying not only causes the legs to bleach out, but it makes the plumage somewhat rougher, etc., and the bird shows signs of wear.

It seems too bad that some of our experiment stations, etc., seem so antagonistic to the fancy. This report, above mentioned, showed photographs of two White Wyandotte hens, giving their egg records, also their score cards. One of the hens had pretty good Wyandotte type, a good head, neck, back, etc. She had the higher score of the two birds. She also happened to have the lower egg record. She was not cut for color of beak, legs, etc. The other bird was no Wyandotte at all. She looked something like a Leghorn in profile, but was more stocky and closer to the ground. She had the long, sweeping back and tail of the Leghorn. She

received a very low score. She had a small cut for color of legs and beak, and was cut severely for lack of symmetry, lack of general Wyandotte type, etc. She happened to have a higher egg record than the other bird. The text under the pictures went on to explain that the Standard gives the prizes to the poor layers, and then gave as proof the two pictures of Wyandotte hens. I do not claim to be a judge of poultry, but if I had been scoring those two birds I certainly would have disqualified the second bird for absence of breed characteristics. The reason the other bird won was because it had some shape, not because its legs happened to be a shade darker.

Too many people seem to think that what constitutes a show bird is 95 percent feathers (color) and 5 percent comb. Often when someone comes to me to buy a cockerel he only looks at his comb and counts the points. Other look first at the comb and then spread the wings and look at the color. Some people say that they do not want a fancy show bird; they only want a good utility bird. Then I show them such a bird and they begin to count the points on his comb, and if he happens to have six he will not do. Anyone who owns a copy of the Standard of Perfection knows that shape counts most,

First Prize S. C. White Leghorn Cockerel, Chicago Coliseum Show, December, 1920. Owned by Frank D. Rogers, South Street Road, Elgin, Illinois.

Quality Prince, the 1918 Heart of America Sweepstakes White Wyandotte Cockerel—Owned by D. D. Sullivan, R-2, Martinsburg, Mo.

and that symmetry, weight and condition all have a value. It is the utility men and not the fanciers who are narrow-minded about the thing. Recently I saw a letter to a farm weekly than ran something like this: "I hear that most heavy laying Leghorn hens have high tails. Is that so? If that is so, why not make the Standard for a high instead of a low tail, as we surely want good layers?" The angle of the tail has absolutely nothing to do with the laying ability. Laying ability is deeper than the surface.

I really think that certain changes should be made in the Leghorn Standard, but they should not be made in a hurry. Remember, it was not so long ago that people believed that a large comb and high tail made a good layer. Where are those theories now? Even two or three years ago the Hogan system was considered accurate. Now the prominent poultry instructors have given up trying to decide what constitutes the "egg type" and are being guided by abdominal capacity, pigmentation changes, wing molt, etc. Walter Hogan's system was based on the "fact" that egg type consisted of the relation of the abdominal capacity to the thickness of the pelvic bones. Prominent utility men say that the bones should be straight, pliable and far apart, but they do not say that they should be thin. All these questions should be investigated thoroughly and conclusions carefully tested out before the Leghorn Standard is taken to pieces, in order that it may be put together right again.

J. V.
New Jersey.

Illinois Egg Contest Under Way.

The first monthly report of the Illinois Egg Laying Contest has been issued. It shows the Orpingtons, Reds, Rocks, Wyandottes and Rhode Island Whites in the lead. Six birds of these breeds laid from 20 to 24 eggs each during November. There are forty pens of six birds each in the contest. Twelve cases of diphtheritic roup developed and these were quickly checked by putting eight drops of normal tincture of bromine in each four gallons of drinking water.

New Pastime for Egg Dealers.

When time hangs heavy on the hands of the poultry farmer or the egg dealer he might find relief in taking up "egg cracking," which is one of the seventeen national sports of Albania.

When some of us were boys we used to tie a horse chestnut on the end of a piece of string, and, meeting a friend similarly armed, used to whirl the horse chestnuts rapidly about our heads and bring them together with a crack. After a few repetitions of this, one of the chestnuts broke. The survivor was pronounced the victor.

Egg cracking is carried on in the same way. The eggs are held in the right hand and tapped together until one of them expires. The winner collects the purse and a few side bets made with the spectators. Hali Berri, who has been in the egg business for sixty years in Albania is the proud possessor of the country's champion egg, which in the course of its long uncracked career has split the yolks of a hundred and thirty opponents. The old egg merchant has found that each new contest brings to his shop a throng of spectators who in their eagerness to wrest the championship from his famous egg, eventually buy, only to have their entries meet the fate of all the others. It is good salesmanship, for the veteran egg merchant not only makes a nice profit on every egg cracked, but also cashes in on the bets made by himself.

American Red Cross workers in Albania have sometimes felt that they ought to arrange an international match between American eggs and the Albanian product. But one and all admit that the American egg isn't strong enough to have a chance. It would be interesting to know what Hali feeds his hens. Eggs like his could be shipped in burlap bags across the continent.

EVERLAY BROWN LEGHORNS

Will Help YOU!

First Prize Pen Cockerel.

The Famous Everlay Strain Brown Leghorns are noted for their vitality, hardiness and winter-laying qualities as well as their renowned show performances. Why not make your flock one of these healthy, active, money-making Everlay flocks? Everlay Farm is headquarters for this great winter-laying, egg-record strain. It is the largest farm in America devoted entirely to the one strain and one purpose, and I have literally hundreds of cockerels, hens and pullets at most reasonable prices. Try a few cockerels to head your farm flock and turn it into a money-maker. Lusty cockerels for the flock, Light or Dark \$5 each, while they last; \$15 cockerels, \$10; \$25 show cockerels, \$15; \$35 cockerels, \$25, and \$50 cockerels, \$35.

Special pen offer to start you: Four \$10 hens or pullets and \$15 cockerel, at \$40. Other big bargains in my catalog! It's free!

Sensational Winners

The Everlay Strain has long been known for its beauty, those long, graceful lines, bright red and golden color, always a thing of beauty in city lot or on the farm. At every prominent show you will find Everlay Brown Leghorns among the leading winners for my customers. For 3 years they won **Best Display**, more prizes, at the great **Madison Square Garden**, New York. At the recent **Chicago Coliseum Show** they won **MORE FIRST PRIZES**, 7 of them, than all the other 19 exhibitors!

World Record Layers

The Everlay Strain was developed to Lay. For many years greatest care has been taken in selecting with this one thought uppermost. Our efforts have been crowned with the

Official Seal of Success

A World's Record made at the American Egg Laying Contest. Get my catalog telling all about these marvelous egg-machines. Send for the cockerels to head your flock today! Safe delivery guaranteed anywhere. You take no risk. Write fully your needs.

VALUE OF POULTRY MANURE.

Agricultural textbooks and bulletins contain many analyses and much information respecting the manures of the larger farm live stock, but the matter of poultry manure has received scant attention in investigatory work and farm literature. Probably the chief reason for this has been the thought that poultry manure, on the ordinary farm, is not produced in sufficient quantities to make its consideration of any practi-

are voided together as a moist mass insures against the loss from drainage of urine, unavoidable to some degree with the larger domestic animals, and explains in part its high nitrogen content. Another reason for its richness in nitrogen and phosphoric acid may be found in the character of the feed used. This is especially true with respect to laying stock, to which it is customary to feed meat scraps, green bone and similar products with high percentages of nitrogen and phosphoric acid.

ANALYSES OF MANURES.

Kind	Particulars	Water	Nitrogen	Phosphoric acid	Potash
Poultry	Laying Stock—				
	Grain fed	74.6	1.12	0.97	0.52
	"	72.3	1.11	0.88	0.49
	" with green bone..	72.6	1.42	2.01	0.42
	Fattening Stock—				
	Crate fed with milk.....	65.8	1.53	0.78	0.38
Horse	Yard fed, "	74.3	1.31	1.04	0.55
	Average	71.9	1.30	1.15	0.47
	Average, excreta plus bedding..	48.7	0.66	0.22	0.58
	Average, excreta plus bedding..	75.2	0.57	0.14	0.49
	Average, excreta plus bedding..	59.5	0.90	0.33	0.95
	Average, excreta plus bedding..	74.1	0.49	0.30	0.45

cal importance. It will not be difficult to demonstrate that poultry manure may be a valuable, if not a large, asset on the farm and that with those making poultry keeping a specialty it ought to be regarded as a by-product which can measurably increase profits.

Poultry manure is undoubtedly the richest manure produced on the farm. In common with all other manures it has not a fixed composition, but the fact that the liquid and solid excreta

The Division of Chemistry of the Canadian Government, has recently analyzed a series of samples of poultry manures, collected without litter or absorbent, produced on the Experimental Farm, Ottawa, obtaining results given in the following table. For the purposes of comparison the average composition of various farm manures, excreta plus bedding (fresh), is appended.

From these data it may be concluded that, speaking generally, poultry ma-

FIRST AND SECOND PRIZE LEGHORN COCKERELS HEART of AMERICA SHOW 1920.
OWNED BY WHITE HILL FARMS LITTLE BLUE MO.

nure, as collected beneath the roosts, is from two to three times richer in nitrogen and three to eight times richer in phosphoric acid, than the ordinary farm manures. On the basis that the excreta that can be collected beneath the roosts per annum per adult fowl, amounts to twenty-five pounds—a conservative estimate—the value of the plant food in the manure from a flock of twenty-five hens that can be obtained and employed for garden or field use, per annum, at pre-war prices of the fertilizing elements, would be \$2.31. At present prices the value would be, approximately \$4.

Poultry manure ferments very quickly,

losing, if left exposed, a large proportion of its nitrogen as ammonia. This fact emphasizes the desirability of systematically and frequently cleaning off the boards beneath the roosts—a plan that also conduces to the general good health and thrift of the fowl. In summer the manure, previously mixed with loam to destroy stickiness and facilitate distribution, may be applied directly to the land and worked into the surface soil—its best preservative. In winter (and at other seasons if the manure cannot be directly used) it should be mixed with a fair proportion of loam, dried peat, muck or sawdust, together with a little

land plaster or superphosphate to fix the nitrogen, packed tightly in barrels or boxes, and stored, protected from rain until required in the spring. Lime and wood ashes should not be used for this purpose, as they set free nitrogen.

Poultry manure being essentially nitrogenous is particularly valuable for garden and leafy crops generally and the majority of poultry keepers will no doubt do well to reserve it for this use. However, if the amount available permits, it can be profitably employed for the cereals, grasses, roots and corn.

EVERY DAY

Is "PAY DAY" When You Have

AMERICAN POULTRY FARMS

BRED-TO-LAY QUALITY BRED-TO-LAY

CHICKS - EGGS - BREEDERS

Nothing is so gratifying to the poultryman as to go out day after day in the cold winter months, and gather a good supply of eggs. It is not only the money value of the eggs, but it means that he has succeeded where so many have failed. For sixteen years egg production has been a study with us, and we have succeeded to the point where we believe our hens just can't help from laying. It is just this kind of stock we are ready to pass on to you. We have nearly \$50,000 invested in poultry equipment and thousands of dollars in fowls themselves. All this proves but one thing: we can supply you with Bred-to-Lay stock that do lay.

Rocks, Reds, Leghorns, W. Wyandottes, Buff Orpingtons

We have not lost sight of the fact that beauty is a big factor in the pleasure as well as profit gained in poultry. They are bred for Standard qualities as the show winnings prove. They are just what you will want to build up your flock, or get for foundation stock which will show its good blood for years to come.

SCIENTIFIC BREEDING WINS

New Laying Records Made Possible by Systematic Breeding—Pedigree Egg-bred Males Increased Production of one Flock from 140 to 160 Eggs.

By T. S. Townsley

Practically every year sees new high laying records set up by hens under official test. A new individual record for the National Egg Laying Contest at Mountain Grove, Mo., was established by a hen in pen No. 45 when she laid 296 eggs during the year which ended October 31. An average of 187 eggs for each hen in the contest just finished at Mountain Grove also establishes a new high record for that station. Similar reports appear from time to time from the other laying contests, indicating that record breaking hens are constantly being produced.

Credit for this development of phenomenal layers must be largely given to improved breeding practices. Not much advancement in feeding methods has been made since the laying contests were started, and in most cases no changes have been made in the housing conditions in the contest pens. On the other hand, breeding methods are constantly improving. In fact, in many cases it is possible to go into the history of high record birds and show how they have been produced by the application of scientific breeding principles.

The hen in pen 45 at Mountain Grove, mentioned above, was entered by a man who has been trapnesting and linebreeding for several years, so she is not a product of chance but of carefully applied breeding laws.

Lady Walnut Hill of Kentucky, a hen with a record of 94 eggs in 94 days and of 810 eggs in four years, is another example of the triumphs of breeding. The grandsire of this bird was hatched from a 248-egg hen and he was mated to a pen of prize winners in the 1914 Missouri laying contest to produce the blood lines responsible for this record. Two sisters of Lady Walnut Hill laid 258 and 216 eggs in the Kentucky contest.

Truly, "blood will tell" when the breeder knows how to make use of phenomenal producers.

More than 100 pedigreed cockerels

have been distributed to Missouri breeders this fall from the University of Missouri poultry flock, and each of these males is the son of a hen with a trapnest record of more than 200 eggs. A noteworthy thing about the pedigrees of these males is that a large percentage of them trace back to male No. O666T. The ancestry of O666T is uncertain, but his progeny has been carefully preserved and has been of inestimable value in building up a high laying strain in the University of Missouri flock.

Influence of the Male.

The Maine Experiment Station made a great contribution to poultry breeding science through the experiments showing the relationship of the male to the character for high egg production in the female. In these breeding tests only eggs from 200-egg hens were set during a period of ten years, and at the end of that time the average egg production of the pullets showed no improvement as a result of this long period of selection. The effort was made to increase production from the female and all the emphasis was laid on the female and her trapnest record. When Dr. Pearl was placed in charge of these experiments he changed the plan of procedure by using only males that were the sons of 200-egg hens. The resulting pullets showed a marked improvement over the records of the pullets produced from hens with high records but from males without records.

These results give rise to the sex-linked theory of inheritance of egg production, which maintains, in brief, that the factor for high egg production is transmitted from the hen to her sons rather than to her daughters, while the male in turn transmits this character to his daughters. According to this theory, in order to secure high record pullets it is important that the male used be the son of a hen with a high record.

The work of many other experiment

The Missouri team, with coach, winning high honors in the Intercollegiate judging contest, Chicago Coliseum show. The men are M. J. Bonham, E. W. Henderson, Prof. H. L. Kempster, coach, and M. A. Seaton.

stations has corroborated the findings of Dr. Pearl by showing how a male from a high producing strain will transmit this character to his daughters. At the Kansas Experiment Station a flock of mongrel hens with a record of 72 eggs in one year, mated to a high egg strain White Leghorn male, produced daughters that laid 160 eggs and granddaughters that averaged 188.

The application of Dr. Pearl's discovery, that high egg production is a character linked with the male sex, has enabled the breeders to make rapid strides in building up high laying strains.

Value of Linebreeding.

A more general understanding of the benefits and limitations of linebreeding has also assisted the breeders to triumph in the laying contests. Scientific investigation has shown that linebreeding affords the most certain means of intensifying and fixing desirable qualities in a strain, and wide-awake breeders have been quick to apply this principle in building up egg strains.

Many poultrymen are still afraid to take up linebreeding because it is a form of inbreeding and they have a wholesome fear of the latter practice. However, the most successful breeders are staking their future on linebreeding and are accomplishing notable results.

Close linebreeding usually involves the mating of a hen to her son or her grandson, or mating a cock to his daughter or his granddaughter. Such a mating as this very quickly intensifies the blood line of the original bird, and since "like tends to produce like," the character and traits of the birds so inbred are quickly fixed in the offspring.

At the Purdue Experiment Station a

hen with a record of 440 eggs in two years was mated to her son and to her grandson, so that the resulting offspring carried seven-eighths of the blood of the original hen. This mating resulted in a large number of 200-egg pullets and produced several cockerels that have shown great value as breeders.

Poultrymen who hesitate to undertake linebreeding in fear that poor vigor will result in the flock should remember that linebreeding intensifies the good qualities of the bird as well as the poor ones. This means of course that only very strong, vigorous birds should be used in linebreeding. If the stock is weak in constitution or low in vitality, inbreeding will intensify that character and will result in disaster. The success of linebreeding depends upon the carefulness with which the stock is selected. A person who practices linebreeding must be a stickler for constitutional vigor and must promptly apply the ax to all specimens showing any traces of weakness.

Trap Nests and Leg Bands Necessary in Pedigree Breeding.

The importance of the trapnest and the pedigree band also deserves mention for their part in helping the progressive breeder build up high record strains. The trapnest furnishes a definite record of the performance of the hen and enables the poultryman to spot the outstanding producers. It also gives him a chance to mark her eggs so that they may be hatched separately. The pedigree band furnishes a means of identifying the chick so that the ancestry can be traced, and by following up the records the value of a particular mating can be accurately measured.

A few breeders have made remarkable strides in developing high layers during the last few years, but the vast field of possibilities along this line appears to have been scarcely touched. The average hen in the United States lays about five dozen eggs in a year, and even in the laying contests, where the conditions are most favorable, a comparatively small percentage of the hens lay as many as 200 eggs.

Breeders everywhere have an opportunity to increase the average production of their own flocks as well as to sell high laying stock at profitable prices. By following the example set by poultry experiment stations and by the breeders who are getting results in high egg production, a large increase in the number of eggs laid can be made in many flocks. The man who trapnests can quickly pick out his high producing individuals, and by making use of the males from these record layers and by linebreeding to intensify the blood he can reasonably expect to build up his own high laying strain.

The breeder who is not in position to trapnest still has the opportunity to buy from reliable breeders pedigreed males which are the sons of 200-egg hens or better. By mating these pedigreed males to the best hens in his flock he can materially increase his egg records.

One Missouri poultryman, as a result of using pedigreed high egg strain males in his breeding for one year increased the average production of his entire flock from 140 to 160 eggs per hen. This increase of twenty eggs per hen from a flock of 500 brought an increased profit of four hundred dollars.

Barred Plymouth Rock EGGS—EGGS—EGGS—EGGS—EGGS EGGS FOR HATCHING

George Beuoy, the man who has done so much to make Capons famous, raises Barred Plymouth Rocks with a national reputation. For more than twenty consecutive years he has bred the one kind only. He specializes on the bred-to-lay kind; exhibits them in the large shows to prove that good ones can be bred from laying stock. Mr. Beuoy has shown his birds at New York, Chicago, Philadelphia, St. Louis, Kansas City, Topeka, Wichita, and more than two hundred other towns, besides winning more first prizes at the World's Fair, Panama Pacific Exposition, than any one other exhibitor. Mr. Beuoy has in all several hundred first prizes won on his bred-to-lay birds against strictly exhibition stock in hot competition. Write to him for a free copy of his new illustrated mating list showing a Barred Plymouth Rock cockerel in NATURAL COLORS on the front page. Low prices on setting eggs. Three matings: Cockerel, Pullet and Standard. A few extra good Cockerels for sale.

SUNSWICK'S GREAT SALE OF

S. C. Buff Orpingtons and White Wyandottes

I herewith offer to MY MANY VALUED CUSTOMERS and the PUBLIC, their LAST CHANCE to purchase from the "CHAMPION SUNSWICK STRAIN" direct.

The property surrounding my farm has changed hands making it impossible for me to continue the POULTRY INDUSTRY in this locality—therefore I have decided to close down, so am offering for sale both of the above BREEDS either in A FLOCK—or SINGLY as preferred. A purchase of the entire FLOCK in either breed represents a VERY VALUABLE PROPOSITION TO THE FANCIER—as the GREAT WINNING AND BREEDING LINE of this FAMOUS "SUNSWICK STRAIN" could thus be maintained—and would moreover take with it the result of 16 YEARS OF SCIENTIFIC LINE BREEDING. Write Quickly if Interested.

Send for Our Beautiful Catalog Today

GET EGGS NOW!

THERE is only one reliable way to secure eggs from your hens in winter and in summer, and that is to *feed for them*. A hen cannot lay a single egg more than the nourishment she receives will permit. Therefore, to get eggs *now*, give your hens Blatchford's Egg Mash, which is composed to the last ounce of wholesome, egg-making materials.

Blatchford's "Fill-the-Basket" EGG MASH

Contains a greater VARIETY of ingredients than any other mash on the market

When hens are fed Blatchford's Egg Mash they receive in *proper form* all the materials they require from which to manufacture eggs. It includes meat scrap, fish scrap, milk albumen, blood, alfalfa, and over twenty other ingredients. It *does* make hens lay. You will receive more eggs from it than from any other laying mash on the market. It is therefore the *best and least expensive* for you to buy. Use it and *get eggs—now!*

WRITE US! Your local dealer undoubtedly handles Blatchford's Egg Mash. However, if for any reason you cannot secure a supply promptly, *write us*. Also let us know if you desire further particulars. We will send you full information and a Handy Egg-Record Card *free*.

TRADE-MARK

THE SICILIAN BUTTERCUP.

By CHARLES C. COOPER.

As never before in the history of the present generation, the people of modest incomes are now figuring how to meet the high cost of living, and a good many who never before have kept chickens will be considering keeping just a few in their back yards so that they may have the eggs, also a chicken dinner once in a while from a bird that they know has been raised on wholesome food, principally table scraps, and kept in clean quarters.

One of the greatest problems for the beginner is to decide upon the breed to select; and in reading the poultry ads, like reading the seed catalogs, he will have to go through a period of perplexing indecision. You know what I mean. To illustrate, take tomatoes or peas in a catalog where half a dozen varieties are mentioned. They invariably delineate them thus: No. 1—the

Typical Sicilian Buttercups. The male shows a red lobe and the female a white lobe. Better breeding is needed in this variety. The head of the male shows the characteristic cup comb.

best, No. 2—one of the best, No. 3—the earliest, No. 4—the finest, No. 5—the most desired, and No. 6—the most luscious, etc.; when the fact is that they are all good, or the seedman would not both with them. So it is with poultry: all the breeds have their good points, or you may rest assured that no breeder is going to put in his time and money and spend his hard cash for advertising a breed unless it is worth while. So, Mr. Beginner, you will have to take into consideration your environment and particular tastes in making your decision, but if this particular article will be of any help, the writer shall feel well repaid for the time spent on it.

Origin.

Having kept chickens and other pets from boyhood, or nearly thirty years, in which time we have handled a number of the better known varieties, we have finally decided to go at it seriously and have settled upon the Sicilian Buttercup. Now don't say, "What kind of a bird is a Buttercup? Never heard of it before! Must be some new-fangled thing." Not at all! It is one of the oldest breeds of which we have record, having been bred in parts of Italy, especially the island of Sicily, for hundreds of years. They tell me that there are paintings by some of the old masters hanging in the Vatican at Rome wherein this ancient breed is pictured.

The story goes that it was introduced into this country by

A New Book—Published 1920

Mating and Breeding of Poultry

By HARRY M. LAMON and ROBT. SLOCUM

SENIOR POULTRYMAN
U. S. Department of Agriculture.

340 pages on how to mate and breed all Standard varieties of chickens, based on the experiences of 81 leading American breeders. Nothing like it ever before published. A companion book to the Standard of Perfection, telling how to produce in full perfection every breed described in the Standard. Fully illustrated with ideal birds and feather charts. Following are only a few of the subjects:

Linebreeding, Inbreeding, Variation, Influence of Sire and Dam, Control of Sex, Prepotency, Mendelism, Selection for Vigor, Introducing New Blood, Single Mating, Double Mating, A Fixed Plan of Breeding, Establishment of Blood Lines, Breeding Birds with Defects, Pedigreeing, Alternating Males, Age of Breeders, Record of Matings, Size of Mating, Breeding Condition, Culling, How High Egg Producing from an Untrapped Flock, Breeding from Trapped Stock, How to Mate Every Variety of Plymouth Rocks, How to Mate Rhode Island Reds, How to Mate Each Variety of Wyandottes, How to Mate All Leghorns and Orpingtons, How to Mate Every Variety in the Standard.

Successful Breeders Endorse This Great Book.

E. B. Thompson says: "The best on the mating and breeding of poultry that has ever been published and will prove to be invaluable to thousands of people."

H. C. Sheppard: "A remarkable work as it covers the ground thoroughly and efficiently."

H. B. Hark: "It will put the beginner on his feet from the very start and he will not have to breed poultry four or five years to find out whether he is right or wrong."

This is an entirely new and original work. ready for distribution. PRICE, \$2.50 PER COPY. 340 pages of heavy book paper, cloth bound, profusely illustrated.

C. S. Byers: "A revelation in Standard fowl breeding with a key to the Standard."

F. H. Davey: "It should be in the hands of every person in America who breeds poultry."

W. H. Card: "Its accuracy recommends its contents to every expert."

John S. Martin: "It covers thoroughly the perplexing points that are continually coming up in breeding."

Every breeder should have a copy. Now

years ago by an old sea captain, who happens to live not very far from my present residence; but it has been only the last six or seven years that they have been bred up to a fixed standard, and anyone who has followed the larger poultry shows cannot help but notice the improvement in uniformity of type and color. The Buttercup is a beautiful multicolored breed, meaning that they are covered with feathers of different color, according to the section of the fowl. In this the male bird is entirely different in color from the female, while the colors of the one harmonize charmingly with that of the opposite sex. In the male the predominating color is a rich, lustrous orange red with heavy greenish-black tail and bay chest, while the hen is a golden buff with greenish-black barring across the feathers. Both male and female have willow green legs, while their comb, from which they have derived their name of Buttercup, is cup or crown shaped—the points being arranged in a circle like the points on a crown, that is, in the ideal comb.

Utility Qualities.

As to their utility qualities, they lay large white shelled eggs, if given a reasonable amount of care and foodstuffs containing elements from which it is possible to manufacture eggs. No breed of chickens in existence can make eggs out of sawdust and water, nor do we mean when we speak of table scraps such things as banana skins, orange peel, lemon rind or decayed fruits and vegetables. I mention these things, as some of the table scraps passed over to us from some of our well meaning neighbors consisted mostly of the above, and it is needless for me to say, found their way no further than our garbage can. When used for the table, the birds dress a nice yellow skinned carcass of fine flavor. The hens run about five pounds and the males six to seven pounds—about the right weight for the average family. We find them light feeders compared to the number of eggs laid, and if given an opportunity to forage they will gather the larger amount of their food, that is, during the months when there is anything to be found out of doors that a fowl can eat. We find a ready market for our eggs for table use, and our customers are willing to pay a premium for them, as they all comment upon the flavor. We also find a ready market for our hatching eggs and surplus stock at very fair prices, and are now receiving letters and orders for hatching eggs—quite a few from the west and middle west. Have just booked an order from California and received recently an inquiry for stock from the state of Washington; so you will see that the demand for this breed is growing and is not confined to this locality alone.

These birds are very docile, stand confinement well, and, if allowed, become fond pets. Do you ask how they stand cold weather? Well, last year was some winter, and our flock was housed in the Dr. Prince T. Woods type of open front houses with only muslin covered frames to cover the open fronts on very severe and windy nights; still, our birds laid as well as any of our neighbors', regardless of breed, and we had only a couple of birds show any signs of colds. Those we disposed of immediately as not being fit to breed from. Mr. Beginning, also Mr. Fancier, if you want a breed that is bound to become very popular on account of its

intrinsic value, i.e., layers of the much desired white shelled eggs, and many of them, yellow skinned bodies, and their docile manner, you will make no mistake in trying the modern Americanized Sicilian Buttercups.

As a Standard Fowl.

Now that the Sicilian Buttercup as it is bred today in this country has been admitted to the Standard by the A. P. A. as a Standard breed of poultry, the writer knows of no other breed that can better combine the utility with the fancy. The result of having a single and fixed standard to go by is apparent to the observing person who has fol-

red hackle and saddle feathers, bay colored chest and large black tail with lustrous greenish-black sickles, is sufficient to attract the eye of any fancier; and the females, with their golden buff feathers barred with black, elongated spangles, makes a pretty and harmonizing mate. Yes! it is harder to breed these birds true to color than a breed where both the male and the female are of the same color, as all white or buff or black, but, instead of this being against the breed, it should make them all the more interesting to the true fancier. Thus we combine the utility with the fancy.

Home of Close-to-Nature Co., 38 Front St., Colfax, Iowa; Manufacturers of Grain Sprouters.

lowed this breed for several years past, and goes to show what can be done by man in following the laws of mating or breeding.

The Buttercup has held on through years of neglect and promiscuous breeding by its intrinsic utility values, i.e., the heaviest of the yellow skinned breeds, laying a large white shelled egg and many of them, being as a breed non-setters and late molters, easily confined, small feeders in proportion to the number and size of the eggs laid; still, they are good foragers and if given range will pick up a large amount of their feed. The birds are very beautiful, both male and female. Visitors to our yards upon seeing them for the first time invariably exclaim, "My, aren't they pretty!"

The male with his lustrous orange-

GEESE FOR PROFIT.

One of the most profitable side lines for the small farmer who is blessed with a bit of extra grassland is geese. A great deal of land is not necessary, an acre providing enough feed for quite a flock. The goose is essentially a grazing bird and can pick up its living in a pasture like a sheep, although it does not eat the leaves of bushes to any great extent. The goose prefers fairly short tender grass like that of a lawn where all the grass can be eaten. It is by no means necessary to have a brook for the geese, because although they enjoy swimming, they can be raised successfully with merely fresh water to drink, which should be supplied abundantly in a fairly large container such as a pail. Geese will also thrive in less marshy

ground although it will require more land usually as there is usually less tender, edible grass on such land.

The size of the flock which can be most profitably maintained depends largely on the amount of available pasture land. Usually all that can be raised can be sold, if not at home in some of the city markets. The usual family flock consists of two or three geese and a gander. One gander will not mate with more than this number, and once mated they should not be broken up as they are much harder to mate than chickens. A goose will lay from thirty

nothing to feed a flock of this size with an acre of good grass except a little grain to fatten them on and perhaps a little after the grass was frost killed, there would be a profit of nearly \$100 which would not be a bad investment.

The two breeds of geese which are most widely known are the Toulouse and the Emden. The Toulouse are gray and the Emden snowy white. To me the Toulouse are the most satisfactory being a little heavier and the goslings more hardy. But this is only a matter of personal preference, both breeds being a good deal alike.

Arthur Duston Posing First White Wyandotte Cockerel and Champion Bird at Hanover Fair. Owned by Arthur H. Shaw, 502 Grove St., Wellesley, Mass.

to fifty eggs in a season, and from twenty to forty goslings may be hatched. Twenty is about all that should be raised, if there is only one acre of land unless they are fed extensively from the outside. A market can be found for eggs with those who wish to raise some geese at a price of fifty cents per egg. When a flock of twenty is raised three or four can be saved for home consumption, and the rest can almost always be disposed of among the neighbors for Christmas and Thanksgiving feasts for \$6 or \$7 per head. As it would cost

The geese begin to lay in March usually at first on the ground, but they soon make nests in some corner and lay in them. If the early eggs are removed and set under hens the geese will lay a second litter, which they should be allowed to hatch as a rule. If they begin to lay very early they may, however, be coaxed to lay a third. A hen will cover four or five eggs. If the eggs are set under hens, during the last two weeks they should be moistened with lukewarm water. This rots the shell to some extent, and enables the

It Isn't Money—It's the Man

that brings success in poultry raising—the man or woman who has charge of the birds. Large capital, a big flock and complete equipment may fail to produce profits because the owner does not add the most important factor—constant watchfulness. The worst blunder the poultry raiser can make is to neglect to fully protect his flock against disease. A few hours spent applying

CARBOLA
The Disinfecting White Paint

Will Prevent Disease, Lice, Mites, etc., from Taking Your Profits

Carbola, a white paint in powder form combined with a germicide many times stronger than pure Carbolic acid, does all the things that whitewash and disinfectants together do and does them much better. It gives you a more lasting paint. Gives you a more dependable protection against the start and spread of roup, white diarrhoea, cholera, glanders, contagious abortion, and other contagious diseases of hennery, stable or hog house. Kills lice, mites, fly eggs, etc., with more sureness. And it is harmless to the smallest chick or stock that licks a painted surface.

Carbola is mixed with water and ready to apply in less than five minutes. No straining or waiting. Does not clog the sprayer. Does not peel or flake. Does not spoil by standing. None of the annoyances of whitewash. Costs but half the time, labor and money required by whitewash and disinfectants.

Use Carbola Instead of Whitewash and Disinfectants

in poultry houses, stables, hog pens, cellars, kennels, factories, creameries, outbuildings, etc. Apply with brush or sprayer to wood, brick, stone, cement or other surfaces, or over whitewash. A gallon (a pound of the powder) covers 200 square feet. Unexcelled also as a lice powder. Used and endorsed by thousands of farmers, large and small, and by leading agriculture colleges and experiment stations.

Your hardware, paint, drug, or seed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Satisfaction, or money back.

10 lbs. (10 gals.) \$1.25 and postage. 20 lbs. (20 gals.) \$2.50 delivered. 50 lbs. (50 gals.) \$5.00 delivered.

goslings to emerge with more ease. One of the chief troubles I used to have in raising geese was in getting them hatched, and this putting water on the eggs helps a great deal. The goslings hatch in four weeks and are apt to be a day or two late. When the goslings hatch, they are easy to raise and grow with almost unbelievable rapidity, but care should be taken to prevent them from getting wet and chilled as this is very apt to kill them. When they begin to feather out they may be safely let out on free range with a shelter against heavy storms, and they will get their own living from the grass. When they are to be killed, grain should be added to their ration to fatten them. After the young ones have been killed the old breeders are kept to furnish eggs for the next spring. These old geese, of course, have to be fed through the winter and given suitable shelter. They will be useful almost indefinitely as geese live to great age, some individuals are said to have lived for over half a century, and they do not depreciate as regards value as breeders. If, however, they have to be replaced or if a larger flock is desired the birds of two years or more should be given preference to breed from as the eggs of yearlings are more apt to be infertile and the goslings less hardy.

Albert L. Sylvester, Jr.
Massachusetts.

BETTER BREEDING RESULTS.

By OTTO E. HACKMAN.

Now that another breeding season confronts us we must give due thought to our breeding pens. We should not rest satisfied with the results obtained the past season, and endeavor only to equal the same. Rather, we should strive to effect a noticeable improvement. Advancement, both in improvement and enlargement of the operations, should be the aim of all, both great and small. Hard work, and an endeavor always to exceed our previous efforts tends to progress and success, whereas indifference leads to stagnation.

In order to realize our aspirations we must put special stress upon breeding. We must use intelligence and foresight when putting together our breeders for the coming season. We may have good stock and give it good feed and care, but unless we exercise proper care in the selection of the birds intended for a place in the breeding pens, and have the "know how" to so put them together that the results we desire to obtain will be realized, we cannot make the progress essential to success. Good comes from good, and bad from bad. Therefore, only careful selection, and breeding from the best will crown our efforts with success.

Weak, improperly developed progeny can often be attributed directly to the indiscriminate mating of the breeders. Haphazard selection never gets one anything. No birds should enter the breeding pens that fail to come up to the standard of health and vitality set for them—and one should have a standard of health that the birds must attain. A bird that has been sick should not be bred from. Such birds, when recovered and placed in the laying pens often net the owner a small profit, but they should not enter the breeding pens.

The birds that are put in the breeding yards should be those that have developed steadily and naturally from

NEW 80-PAGE BOOK FREE

Valuable Information on How to Get Big Winter Egg Yields—How to Tell Slackers and Poor Layers—Saving Feed—Keeping Hens Vigorous and Free From Disease.

Written by T. E. QUISENBERRY

YOUR big opportunity is at hand. Never before have poultry raisers been confronted with a condition of high egg prices alongside of low feed prices.

In many sections of the country, one dozen eggs will pay for two or three bushels of grain, and there is no indication or reason for eggs to drop in prices for some time.

Fresh nearby white-shelled eggs in New York are selling at \$1.25 per dozen. The retail prices of western fresh white-shelled is \$1.04 per dozen. Fresh country eggs, assorted colors, retailed at 95 cents to over \$1.00 a dozen on December 1 in many large cities. January and February prices are certain to be higher.

Now is the time for poultry raisers to make the most of this opportunity for high profits. For weeks, months—yes, for years—to come there is a sure and big profit in egg production for those who know the simple, easy feed and labor-saving methods of getting big egg yields.

But right there is the "Pea in the Pod" of the whole business—you must know how to cull and select your good layers. Thus you save the cost and food ordinarily consumed by loafing, unprofitable hens. Then you must know how, when, and what to feed to insure big egg yields and the saving of feed.

T. E. Quisenberry,

Author of this big, new 80-page book is recognized as one of the most successful poultry farmers and egg producers in the world.

That is why we are particularly pleased to announce to our readers that this big, new 80-page book by T. E. Quisenberry, President of the American Poultry School, Department 206, Kansas City, Missouri, will be sent to each and every reader who writes for one. You want plenty of eggs now, and Mr. Quisenberry's new 80-page book will show you how to get them right now.

This book by Mr. Quisenberry contains 80 pages of interesting poultry reading, many photographs of poultry, buildings, equipment, etc. However, there are sixteen pages especially devoted to telling "How to Get More Eggs on Less Feed—How to Get Big Egg Yields During Cold, Stormy Winter Days—How to Keep Hens Healthy and Happy—How to Cull Out Loafers and Select Layers—How to Get Fertile Eggs and Prevent Dead Chicks in Shell at Hatching Time," and hundreds of other money-making and labor-saving ideas for poultry raisers.

Never before has there been offered, with out any charge or obligation of any kind, a book containing so much real valuable and dependable information that is certain to help every poultry raiser. We hope every reader will write Mr. Quisenberry for one before they are all gone.

the time they were hatched until maturity was reached. They must neither have suffered a stoppage at any stage of their growth nor should they be birds that were forced for quick growth at the expense of hardiness. The best condition under which breeding stock has been cared for is free range, roomy quarters, lots of good wholesome food, and freedom from vermin. Pampering the birds with the expectation that better results will be obtained is an error. Far better to have the fowls rough it to a certain extent. Such treatment makes the fowls rugged and keeps them in the best of breeding condition.

Select the Male With Care.

As the male bird is the sire of every chick hatched from his pen, he may rightfully be considered half the pen, and it behooves us to exercise the utmost care in selecting the pen headers. Should we use one or two inferior females, the bad results will not be so noticeable, as these hens compose only a small part of the pen, and only those chicks hatched from their particular eggs will be poor. Not so with the male bird, however, for his power for good or evil is great. Were he an inferior bird, the results would be disastrous.

The pen header should be well built—a husky bird. He should be Standard weight, without being excessively fat, and should be typical of the variety he represents. His legs should be stout and set well apart. Eyes should be large and bright, skull broad, and neck short and thick. He should be a lusty crower, as this denotes vigor, and he should be capable of holding his own anywhere. He also should be a good eater, but not greedy and vicious so as to deprive his consorts of their share. Neither should he be so gallant as to deprive himself in order to let his companions have the food. In such cases he should be fed by himself.

After deciding on our male bird we must turn to the selection of the females. It is generally conceded that the hen influences the size of the progeny. Therefore, if one finds it necessary to use a male that has not attained the desired size, he should mate him with large hens, thus overcoming the tendency to undersized progeny.

All the females in the same pen should be as alike as possible. The defects should, in so far as possible, be similar in the females, so that by proper mating they will be overcome in the progeny. We should never have females in the same pen have the same defects as are carried by the male and expect the young stock to show improved quality. It cannot be done. Slight defects in certain sections of the females can be corrected if the male bird is especially strong where the females are weak.

Hens Are the Best for Breeding.

It is at all times advisable to use hens in preference to pullets for breeding. Pullets are, at best, an unknown quantity. Pullet eggs are at first undersized and therefore too small and lack the vitality to provide strong, quality chicks. Also, in using pullets we cannot be certain as to their laying ability. Their first few weeks' egg record is no criterion of their yearly output. Some pullets, not being physically capable of standing up under the strain of continued production, break down and are unfit for breeding.

AMERICAN POULTRY JOURNAL :: 523 Plymouth Court :: CHICAGO, ILL.

Globe Incubators ARE MADE TO HATCH

Our facilities for studying natural incubation are the most favorable, as poultry raising is our only occupation. From careful study we evolved

A Perfect Incubator and Brooder Machines that are dependable, because they are self-regulating and automatic in the most vital operations.

Shoemaker's Poultry Farm

is one of the largest breeders of Standardbred poultry in the world. We raise 48 different breeds and varieties of fowl, and can supply breeders or hatching eggs when wanted in season.

Shoemaker's Poultry Almanac and Incubator Book for the Year 1921 has about 200 pages, illustrated with many colored plates of fowl, true to life. Tells about chickens, their cost, care, diseases and remedies. All about incubators, their prices and operation. How to get good hatches, etc. How to build poultry houses, etc. Only 20c. Money back if not satisfied.

American Poultry Journal, #23 Plymouth Ct., Chicago

The new home of the Dr. L. D. LeGear Medicine Company in St. Louis, Mo., just completed, contains one of the largest laboratories in the world for the production of stock and poultry remedies. It will occupy this entire building which is 200 by 200 feet. Two full stories are below the surface of the railroad track and two above it—one-half of the building has three floors below the surface. It is of reinforced concrete and of brick fireproof construction throughout.

It's Brooder Time

Time to get brooders ready to raise the early chicks

Don't repeat last season's mistakes. If you are planning to grow a big, profit-paying lot of chicks you should do two things:

First—have your brooders set up, tested and ready *before* your chicks arrive. Failure to do this may mean loss of the whole hatch. You have time now—you'll be mighty busy later.

Second—use the brooder that "raises the most chicks, the best chicks with least labor and at lowest cost." One brooder meets these practical specifications—*that's the NEWTOWN.*

The NEWTOWN is the original coal-burning colony brooder—the machine that completely changed brooding methods. Like all good things, it has been widely imitated, but it is still unequaled. Coal-burning, self-feeding, self-regulating, safe and economical, it reduces chick-growing costs to the lowest limit.

Then there's the NEWTOWN oil-burning colony brooder. Equipped with a simple but powerful oil-burner, it possesses the essential features of the always-popular NEWTOWN coal-burning machine. It is simple to operate, safe and durable. Automatic regulator controls flow of oil—safety adjustments control operation. Adapted to large and small plants—and satisfactory everywhere.

So we advise that you order your NEWTOWN BROODERS early—*now*. Then you will be sure. Delay may mean disappointment and loss. Write for that catalog.

An Interesting Message About Incubators.

We have increased the output of NEWTOWN GIANT INCUBATORS. Can accept two or three orders for spring delivery. Write or wire the size you need. We will promptly supply full information.

ANDREWS CARRIERS

For Baby Chicks

Three sizes, for 25, 50 and 100 chicks. Built to conform to International Baby Chick Association specifications. Car lot orders made to meet buyer's specifications. Strongly built of heavy corrugated board—waterproof inside and out—shipped flat—set up in a jiffy. And they carry the chicks in comfort and safety.

Andrews Carriers are made in one of the world's greatest box factories. We can promptly make shipments of any quantity—from two dozen of a size up to a carload. And our prices are surprisingly low. Andrews Carriers are right. "Ask the Judges." Write now for complete catalog.

O. B. Andrews Co., Dept. A, Chattanooga, Tenn.

For Eggs

Ten sizes—ranging from 12 to 120 egg capacity. These carriers absolutely prevent breakage. Further, they protect the egg-contents by preventing shocks. Each egg protected by several thicknesses of corrugated cushions. Simple and practical. Can be used many times, but cheap enough to throw away after a single trip.

What's a CAPON and why?

A book that explains everything you will ever want to know about CAPONS. 50 pictures from life that show each step in the operation. List of Capon Dealers' addresses. Tells how to prevent "Slips" where to get the best and cheapest capon tools. Capons are immense eating. Big profits realized. Get wise. This book tells how. Copyrighted new and revised edition. Regular 50c copy, prepaid to your address (a short time only) for a Dime in coin or stamps. **GEORGE BEUOY, R. R. No. 7, CEDAR VALE, KANS.**

A Revolutionary Achievement!

2-Yr. Old Trees Bear Fine Apple Crops!

When we paid \$5,000.00 for the original Golden Delicious tree some years ago, we "builded better than we knew."

Reports from growers in 20 different states show that Stark's Golden Delicious trees bloom and bear apples when *two years old*. When Prof. Crane of Madison, Wis., Member of Executive Committee, American Pomological Society, visited us, in company with State Horticulturists of 12 other

great states, in late September, and saw Stark's Golden Delicious in bearing, he declared: "All the horticultural writers will have to throw away their books on apples because Golden Delicious bears regularly on the new one-year wood—on the lateral buds, like a peach tree. This is wonderful. Unlike any other known apple. These trees mark a long step forward to the world of Pomology. I wouldn't have missed seeing these Golden Delicious trees in bearing for anything. Your photos and descriptions give us no idea compared to the actual trees themselves loaded

with fruit. This feature makes these trees regular *annual* bearers."

F. L. Crane, Horticulturist from West Virginia State Experiment Station, Morgantown, W. Va., (one of the investigating party of the Horticulturists) asserted: "It is likely that this Golden Delicious will be the parent of a family of apple trees that will revolutionize apple growing and *make all the old standard varieties back numbers*."

When shown the scores upon scores of letters from practical, successful growers in states everywhere in the United States, testifying that

Stark's Golden Delicious

trees bloomed and bore in their orchards at 2 years old, the visiting horticulturists were amazed.

Let us quote from just a few of these letters. If we printed them all, we would have to take many pages in this publication.

Illinois—J. Ginther, Bone Gap, Ill. reports: "My Stark's Golden Delicious—2-yr. old—has 21 apples on it. They are fine."

Iowa—Dr. W. E. Lawhead, Burlington, Ia., re-

ports: "The Stark's Golden Delicious I got of you 2 years ago this Spring has made wonderful growth and bore 6 well-formed apples this year."

Missouri—Jos. Jennings, Lees Summit, Mo., reports: "My Stark's Golden Delicious tree had five blossoms and three apples on it this, the 2nd, year. This is the youngest I have ever had apple trees to set." Think of such a record! And then remember the words of Benjamin Buckman of Illinois, one of America's Horticultural and Orchard Leaders: "Stark's Golden Delicious apple is

"Richer, Larger than Grimes Golden—Keeps 4 Mos. Longer"

Letters as enthusiastic as those quoted from above have poured in upon us from delighted growers in Virginia, California, District of Columbia, Louisiana, New Jersey, New Hampshire, North Carolina, Oregon, Pennsylvania, Tennessee, Texas, Iowa, Maryland, Massachusetts, Michigan, Missouri, Washington, West Virginia, Wisconsin and other states.

From New Jersey—A Russell Paul, Belvidere, N.J., reports: "My Stark's Golden Delicious bore 12 fine apples last season (1919) when only 15 months planted. This year (1920)—only 27 months after planting—it bore

something over 100 apples, proving it positively the strongest growing and youngest, heaviest bearer of our 150 varieties! This apple brought the top-notch price over any variety here."

From Virginia—H. D. Didier, Roanoke, Va., reports: "I enclose photo of one of my two-year-old Stark's Golden Delicious bearing 14 apples, which is approximately the average on all trees in the orchard."

FREE CATALOG

Commercial growers everywhere are planting big blocks of Stark's Golden Delicious this year.

You should make it a point to plant heavily

of Stark's Golden Delicious this year—if you want to get the highest prices for your future fruit.

Home orchardists are planting it because of the supreme delicious quality of the apple and the amazing fact that it bears so young.

Post Yourself on Stark Delicious, Too

The highest-market-price red apple that orchardists can grow. The "money-tree of a hundred thousand orchards" from Maine to California. Supreme as a dessert apple. Simply send name and address on coupon—and

A Winning Combination

FUL-O-PEP
GROWING MASH
FUL-O-PEP
CHICK AND FEED

FUL-O-PEP Adjustable Feeder

Ful-O-Pep Feeder Adjusted for Young Chicks

Ful-O-Pep Feeder Adjusted for Half-Grown Birds

Ful-O-Pep Feeder Adjusted for Full-Grown Birds

The Ful-O-Pep Feeder is adjustable to feed chicks from one day old to maturity. You increase size and capacity of feeder to meet chicks rapidly growing requirements by turning the top threaded section to the left—same as you would screw cap from a bottle. Price Postpaid \$1.25

WHEN applied according to the Ful-O-Pep way, this combination of perfect feeds and feeder will positively raise more chicks—bigger and better chicks—than has ever been your experience. Oatmeal is the base of Ful-O-Pep Chick Feed. Ful-O-Pep Growing Mash contains oatmeal, fish meal, bone meal, some bran, cornmeal and hominy feed. From our experiments and the results obtained by thousands of other poultry men we are convinced that Ful-O-Pep feeds, fed the Ful-O-Pep way, are productive of more pounds in gain on less feed and labor than can be obtained from any other feed or method of feeding. Numerous unsolicited testimonials are coming in daily — testifying to the wonderful feeding value of the complete Ful-O-Pep line. You are strongly urged to give these remarkable feeds and method of feeding them a trial. The results will amaze you.

Place an order in advance with your local dealer. Get ready for the chick. Ask for a copy of our 1921 Poultry Calendar. Then secure the Ful-O-Pep Adjustable Feeder direct from us. Price \$1.25, postpaid.

"Aristocrat" Eggs

For Hatching

The sensational records made by my customers—with "Aristocrat" Barred Rocks—during the past few years simply stand unsurpassed in the annals of all Barred Rock history. And this winter, even right now, the winnings made by them are greater and more astonishing than ever before. "Aristocrat" customers are winning out in hundreds of showrooms throughout the United States and Canada, winning out in the very biggest and largest shows of all.—My Customers, in Fact.

Have Created A New World's Record

By their sensational sweep of victories throughout the entire American continent, with their great winnings at these foremost of all Barred Rocks show: The National Barred Rock Club Show (the greatest of all the great ones) Chicago, "Heart-of-America," New York Palace, Guelph, New Orleans, the "Tri-State," Texas State, Cleveland, Detroit, New York State, St. Louis, Los Angeles, Brooklyn, San Francisco, Winnipeg, Pittsburgh, Minneapolis, Indianapolis, at one state show after another throughout the entire Union, and in many, many hundreds of other large shows.

Would you like to produce such winners? Simply get

"Aristocrat" Eggs

For it is to your interest to know that the very same male birds and females (*the same identical cock birds and hens*) which produced the greatest of all "Aristocrat" prize winners last season are again mated up in my yards right now. **THEY PRODUCED THESE PRIZE WINNERS LAST SEASON. THEY WILL NATURALLY PRODUCE SUCH QUALITY AGAIN FOR NEXT SEASON.** These are tested breeders, breeding birds that have been tried out, proven and have made good. **WE KNOW** what they produce.

THE EGGS from these grand producing matings are only

\$15.00 per 15	\$25.00 per 30
\$40.00 per 50	\$75.00 per 100
\$300.00 per 500	

Many a bird of more than \$100 value each was produced out of eggs from these same matings. *It has become well known throughout the country that Holterman is the man who is sending out THE BEST Barred Rock Eggs that can be purchased ANYWHERE at ANY price.*

SPECIAL!

Grand "Aristocrat" Breeding Cockerels

wonderful, guaranteed male birds, linebred, vigorous and with the power to reproduce their own great quality in the young stock will be of priceless value to you. From these magnificent "ARISTOCRAT" Cockerels will be produced many of the most beautiful prize-winning Barred Rock cockerels and pullets in America's shows next season. They are so wonderfully rich in quality that each and every one is guaranteed absolutely. **RIGHT NOW** is the time to get such birds to head your selected pens and flocks. (Rich quality mated trios and breeding pens, ready for service, may also be had if you act at once.)

New Literature and Grand Catalogue

containing overwhelming evidence to prove the above statements to your entire satisfaction—**FREE.**

Remember, that Holterman is the man who is furnishing to other breeders so many of those powerful winners in the world's foremost shows.

Standard Reliable Incubators and Oil Burning Hovers

"Forty Years At It"

Standard Reliable Incubators

Forty years of success with the Reliable Incubators and Brooders is evidence of the quality of our goods. We manufacture everything that is needed on a well regulated poultry farm.

We Manufacture the Following:

Oat Sprouters
Non-Freezable Founts
Stock Food Cookers
Lice Killing Machines
Automatic Feeders
Feed Troughs
Grit or Shell Boxes
Brood Coops
A full line of Metal Drinking Fountains, Incubators and Brooders and Oil Hovers.
Coal Burning Brooders
Many other articles which are positively guaranteed.

The following are a few of the many thousands of successful users of the Reliable goods. Write them and find out how they like them.

The Reliable Blue Flame Wickless Oil Heated Colony Hover

Burns Coal Oil
Steady Blue Flame
Comfortable and Easy to Operate
Economy of Operation
No Wick to Trim
Abundance of Heat
No Oil Fumes
Visible Oil Feed
Convenient and Safe
No Coal Smoke or Gas
The Flow of Oil is Regulated Automatically.

This is the most popular and most efficient hover ever manufactured, as proven by the many testimonials received. You can always get coal oil, but it is hard to get hard coal. You can get any amount of heat with these hovers that is needed at all times.

Thirty thousand Reliable Blue Flame Wickless Oil Heated Colony Hovers sold last season, and every customer satisfied and is a booster.

Can be operated successfully without a lighting ring by generating burner with alcohol or gasoline, but burns less oil by using asbestos lighting ring. We furnish lighting rings with each outfit.

We furnish a one-gallon self-feeder so that you need have no fear of light going out, for it is simple and requires very little attention. It is equipped with a safety valve. After the valve is once properly adjusted you need not pay any more attention, for it regulates the drop of oil. Our ventilator in top of cone of hover leaves out all foul air made by the chicks. This is done automatically, without any bother to the operator, and which insures steady and healthy growth of the chicks placed in its care.

By using the Reliable Blue Flame Wickless Oil Heated Colony Hovers you save time, money and trouble, and your chickens will grow faster, get heavier and thrive because our hover will take the very best care of them, and keep them comfortable, happy and healthy.

Our guarantee is that any goods bought of the Reliable Incubator and Brooder Company will do as we claim for them. If not, and returned by the purchaser within sixty days, your money will be refunded.

Orders Another One

SADORUS, ILL.,
April 21, 1919. Dear Sir: Enclosed find check for one more Feather Board to be sent by Parcel Post at once, if possible. I like the other three I bought of you about a month ago fine; am using them in my Brooder House where I used to use my hard coal brooders. I am using them to warm the Brooder House now and putting my Leghorns under the feathers.

Yours truly, C. M.

Showing "Feather Boards" in a two-compartment feather-brooder
Capacity of each compartment, 75 chicks

Are you using my Feather Brooders?

If not, you are not securing the best possible results. Invest \$5 in one of my Feather Boards with full instructions for making the brooder. Two weeks' use will prove their superiority. Hundreds of my customers are using them with splendid results.

Why Not You?

Book Baby Chick and Egg Orders NOW

Do not run the risk of placing your order too late. The demand has not been so great in many years, and the only way to insure delivery when wanted is to **ORDER NOW**

Choice Foundation Stock

I am now offering, for immediate delivery, yearling hens, pullets, cocks and cockerels, the offspring of my very best layers, at the same prices that were in force two or three years ago. No better foundation stock to be had anywhere.

My catalog contains descriptions of my plant by representatives of the leading poultry publications, reports of many of my customers, and also my methods of breeding, care and management. It is fully illustrated and very instructive, and will prove to you that my prices are very reasonable.

Start right, by writing for my instructive catalog today. It has helped others, and it will undoubtedly help you.

JOHN G. POORMAN, Box 100, TINLEY PARK, ILL.

MITE-PROOF NESTS and ROOSTS**Sold on Money-Back Guaranty**

Stenberg Mite Exterminating Nests and Roosts are sold on a season's free trial. They must absolutely rid the hen house of mites without spraying, or your money back.

Strong and substantial. Ideal for setting or laying. Built open; equipped with vermin and mite-proof sheets and powder traps.

Mite-Proof perches with powder traps which prevent mites from coming off walls or floor onto hens. Protect hens—starve the mites.

Write for catalog of Roosts, Nests and latest improved incubators and brooders. Prices reasonable—goods guaranteed.

BREEDERS OF

HIGHEST GRADE PEDIGREED

S.C.W. LEGHORNS

THE KIND THAT LAY

MAKING RECORDS FOR 1920-1921.

Seattle, Wash., November 10, 1920.

Hollywood Farm:—

Gentlemen—I entered in First Western Washington Egg Laying Contest six pullets hatched May 28th from two settings of your eggs. Five in pen and one alternate. They finished 2nd with these records: No. 1, 279; No. 2, 312; No. 3, 180; No. 4, 293; No. 5, 206; alternate 247 eggs; floor eggs, 19. Had I selected alternate for the pen instead of No. 3 the average would have been 271 1/5 eggs. They did not get credit for a full year's lay because they were hatched late. Number 4 laid 293 eggs from November 19th to October 31st. She would surely have passed the 300-egg mark by November 19th, because she was in full lay at close of contest.

Very truly,

C. H. BURNETT, Jr.

Seattle, Wash., Jan. 9, 1920.

Dear Mr. Atkinson:—

I entered the pen you sold me in Second Western Washington, Egg Laying Contest. They are leading the contest with 271 eggs for November and December, 54 1/5 eggs average. Nearly 90 percent egg yield for two high-priced egg months. Some chickens!

Truly yours,
J. W. MERRIMAN.

Ellensburg, Wash., Jan. 9, 1921.

Gentlemen:—

I just received December report for Puyallup Contest. Pen you sold me has laid 258 eggs, an average of 84 1/2 percent since contest started. How do you do it?

Very truly,

E. M. MADDUX.

Auburn, Wash., Nov. 9, 1920.

Dear Sirs:—

Our pen at First Western Washington Egg Laying Contest produced the highest value in eggs. We give all credit to "Hollywood" males. They not only sired our pen, but they sired 500 pullets that averaged over 200 eggs in last 12 months.

Very truly,

SCOTT O. HOLT.

FIVE YEARS WINNINGS IN COMPETITION WITH THE WORLD'S BEST PRODUCERS, UNDER MANY DIFFERENT MANagements AND CLIMATIC CONDITIONS.

TO THE PUBLIC: We are now offering for sale mated pens, pullets, cockerels and yearling hens with high trapnest records. All this stock is of the same blood lines and closely related to our contest winners. Bred more than twenty 300-eggers and better last season. Believe we are offering stock and hatching eggs from the best flock of high average egg producers in America, if not in the world. Address,

HOLLYWOOD FARM, M. E. Atkinson, Mgr., Box A, HOLLYWOOD, WASH.

BYERS' ORPINGTONS

CHICAGO COLISEUM WINNINGS Past 27 Months

75 of my Orpingtons stood under First Prize Ribbons. (All my competitors combined only showed 16 birds that stood under First Prize Ribbons), and in Bufts this winter I showed 11 birds under First Prize Ribbons, while all my competitors showed but 3 birds under First Prize Ribbons. 172

of my Orpingtons stood under ribbons. I won 13 out of a possible 14 1sts on Pens. And I have never lost Special for Best Display in Bufts, in Whites or in Blacks at this Premier Exhibition. Although I started in Orpingtons in a rather small way, my Strain and Business now represents an outlay of \$130,000. Serving liberally the best interests of new and old customers alike has made possible my continued success and I will stand responsible for the statement that I have more permanently satisfied customers in North America today than any other ten Orpington breeders combined. And it's all because the Orpingtons I sell at a given figure are better in fact. There is no substitute for this blood. Buy it knowing that you are getting the best possible. 300 big, massive, champion bred cockerels at \$7 (2 for \$12), \$15 (2 for \$25), \$25 and \$35. Correctly mated champion bred pens (4 females and male), \$60 and \$90. Richly bred breeding flocks now laying, 50 females and 5 males, \$250. Trios in this grade, \$20. Pens, \$30. EGGS—From Champion Exhibition Matings, \$15 per 15, \$28 per 30, \$45 per 50. From Special Matings of Champion Blood, \$14 per 50, \$25 per 100. Shipments prepaid. Infertile eggs replaced free.

C. S. BYERS,

The Best Breed
Bred Right 20 Years

Hazelrigg, Ind.

Two Good Colony Brooders

*Coal-burning and oil-burning. Both are Newtowns
Take your choice and be happy*

First, the ever-popular Newtown Coal-Burning Colony Brooder, widely used and acknowledged to be the most satisfactory brooder of its type. Known everywhere as "the brooder that raises the most chicks, the best chicks, with least labor and lowest cost." Coal-burning, self-feeding, self-regulating, safe, efficient, economical. First on the market—improved and perfected as the result of experience. It's a real brooder.

The Newtown Oil-Burning Colony Brooder is relatively new, but old enough to be right in every detail. A great number were used during the last year or two, and gave remarkable satisfaction.

Many people prefer oil to coal for use as brooder fuel. So we designed this new machine, incorporating all the valuable features of the original Newtown Colony Brooder but substituting a kerosene oil burner for the coal stove. The new machine is a success—we cannot say too much in its favor.

The big problem was to get the oil burner perfect, but we did it! It is absolutely wickless—burns with a steady blue flame—without smoke or odor—is noiseless—is so efficient that it produces ample heat to maintain needed brooding temperature. And it is economical of fuel, which is a big item.

Ordinary oil burners "slow up" in cold weather, due to thickening of the oil and consequent slow feeding. That means less heat when heat is most needed. In this Newtown burner the oil flow is regulated by a *thermostat under the cover*. And always the fuel flows in just sufficient volume to maintain the temperature you desire. No valves to clog—no trouble at any time.

That's a good story, but it is only part of it. It will pay you to write for the rest of it. We will gladly send it, free.

NEWTOWN GIANT INCUBATOR CORP'N.

21 Warsaw St.

Harrisonburg, Va.

Better get your brooders set up early.
But first read the Newtown Brooder
Catalog. It's a safe guide.

Shall we mail one? Write!

Bronze Turkeys

VIGOROUS BREEDERS

Partridge Rocks

AT MADISON SQUARE GARDEN, 1921

On Bronze Turkeys we won: 1-4-5 Cock; 1-2-4-5 Hen; 1-2-3-4-5 Cockerel; 1-2-3-4-5 Pullet. On Free Range on the "Highlands" in the natural home of the Wild Turkey is where our Giant "Goldbanks" grow and attain that vigor so necessary to produce offspring that will live and grow to maturity.

Exhibition and Breeding Stock for sale.

MEYERSDALE, PA.

BUFF MINORCAS

There is a harvest of wondrous plenty awaiting those who procure the blood of my CHAMPION Buff Minorcas. WHY? Because my quality is five years ahead of all my competition. Ask any one who inspected my late Chicago Coliseum Winners of six Firsts, six Seconds, four Thirds and Best Display. Experts were amazed at their enormous size, true Minorca type and sound color. Cockerels \$5 up. Correctly mated pens, (four females and male), \$25, \$35, \$50 and \$75. EGGS, from Champion Exhibition Matings, \$15 per 15; \$28 per 30; from Quality Matings, \$5 per 15, \$8 per 30, \$13 per 50, \$20 per 100.

Wilburtha Farms

Secure Entire White Rock Flock of Owen Farms

FOR many years these two flocks of the ever-popular White Plymouth Rocks have been recognized as the best in America, and at the most important shows have divided the leading prizes between them. Now they are combined at Wilburtha through the purchase of the entire Owen Farms flock—every bird, without reserve.

This combination of the two outstanding White Plymouth Rock flocks unquestionably makes Wilburtha Farms supreme in this remarkably valuable variety. No other farm in the world possesses such a large number of White Rocks of real quality.

Winnings at Madison Square Garden 1921

Cocks - - - 2, 4, 5	Hens - - - - 1, 5
Cockerels - - 1, 2	Pullets - - - 2, 3, 4
Old Pens 1, 2, 3, 4	Young Pens 1, 3, 4, 5

...This Year... SAVE YOUR BABY CHIX BROODER \$4.96

Cut herewith shows the *Putnam Home-Made Brooder* complete — "A perfectly simple and simply perfect" **LOW-COST** Brooder for saving your Baby Chicks, either those you hatch yourself or those you buy.

See Sample Brooder at Left

Guarantee

I guarantee the Putnam Brooder Heater to give satisfaction or it may be returned to me within 30 days of shipment and the money paid for it will be refunded.

THE materials used to make it were one shoe box; one-sixth yard of oil cloth and one Putnam Brooder Heater. The total cost, including Heater, was \$4.96. A fourteen-year-old boy can build one in an hour with no tools but saw and hammer. This Brooder will accommodate from 25 to 60 chicks and will take better care of them than any brooder made, no matter how elaborate or expensive. Build one NOW and have it ready for the young chicks when they come. Write for plans for making this Brooder and testimonials from satisfied users. I will send you the plans FREE.

Advantages of the Putnam Home-made Brooder

REQUIRES filling **BUT ONCE A WEEK**—no other attention. Patented principle—**EFFICIENCY** guaranteed. Thousands in use. Every **OTHER BROODER** must be filled and trimmed **SEVEN TIMES** a week. Putnam **HOME-MADE BROODER** is adapted to any size plant from 25 to 60 chicks in one brooder to any greater number desired; simply use more brooders. Is particularly adapted to needs of small breeder and back-lotter who aims to produce one lot of chicks or a few dozen.

No other brooder on the market is **EASIER** or more **SIMPLE** to operate; none uses **SO LITTLE OIL** per chick; brooder consumes less than a gallon of oil **A MONTH**. Send for and read the testimonials.

Putnam **BROODER HEATER** is so constructed that it acts **LIKE AN OPEN FIRE PLACE**, carrying the foul air out and drawing the fresh air in, thus providing **PERFECT VENTILATION AUTOMATICALLY**.

Heat is radiated from **ABOVE** onto the backs of chicks, giving the natural and soothing effect **OF THE HEN**—without the lice.

Hover is so constructed that chicks **FIND EXACT TEMPERATURE THEY LIKE**. Adjustable hover takes care of any season from February to July.

Putnam **HOME-MADE BROODER** CAN BE OPERATED ANYWHERE in a sunny room in a house, an open shed, or, if a roof be built on it, out of doors; can be **CARRIED ANYWHERE** by a half-grown boy.

No other brooder is easier to clean and disinfect. Simply lift out hover and heater—brooder can then be emptied of litter and be disinfected.

Brooder heater is made of brass and galvanized iron—**IS PRACTICALLY INDESTRUCTIBLE**.

Capacity of Putnam **HOME-MADE BROODER** IS **ELASTIC**. When chicks require more exercising space, heater and hover can be placed in larger box or other structure. **THE BROODER GROWS WITH THE BROOD**.

Floor of this brooder is even with the ground and therefore chicks do not have steps or inclines to learn, thus avoiding loss from rain or chilling.

To summarize: At no price, **HIGH OR LOW**, can a brooder be bought so economical in first cost, also in fuel and labor—so simple and **EASY TO OPERATE**, so perfectly ventilated, or one that will so surely raise **HEALTHY AND VIGOROUS BIRDS**.

THE BROODER HEATER
Price only \$4.75, Postpaid.

IN SUCCESSFUL USE FOR YEARS

THIS **BROODER HEATER** is in no sense an experiment. It has been on the market **IN SUCCESSFUL USE** for years. Thousands of them have been sold and they have given uniform satisfaction. Here are sample reports—could furnish hundreds of others like them:

ROBADEL FARM USING 24.

Cos Cob, Conn., April 24, 1918.

I enclose herewith my check in payment for the 12 Putnam Brooder Heaters sent me by parcel post. They arrived safely on Monday. Will be very glad if you will send me another dozen heaters some time this week or next. It is our intention to use these brooders entirely instead of hens, as we have come to the conclusion that they are really more practical than the mother hen.

ROBADEL POULTRY FARM,
Per A. C. Robertson.

Fulton, N. Y., May 11, 1920.

We received the Brooder Heater in time and we would not part with it. I have 200 little chicks which we have raised in this brooder and they are doing fine—have not lost one yet. Before we had this Putnam home-made brooder we lost many by their getting chilled when small. MRS. C. W. BENNETT.
Route 1.

Jefferson, Ore., May 8, 1919.

Enclosed find check for which please ship me 2 more Putnam Brooder Heaters. Want these to use myself. These heaters of yours used in home-made

brooder boxes have anything else beaten that I have seen yet. E. J. SHUMAKER.

Magnolia, N. J., April 13, 1920.

Enclosed find P. O. money order, for which send me 2 more Putnam Brooder heaters and one dozen wicks for same. Kindly rush order. Through me you have sold several of these Brooder Heaters, and I certainly do enjoy teaching others how to use them. There is nothing else to equal it on the market. I am well pleased with this Brooder Heater and always praise it just as I have done in this letter.

W. B. BARTH.

How to Order:

I do not sell the Putnam Home-made Brooder. I sell the Brooder Heater only. The price of Heater is \$4.75 postpaid. With every Brooder Heater I will send **EASILY FOLLOWED DIRECTIONS** for making the Home-made Brooder. Your dealer should have the Putnam Brooder Heater in stock. Ask your dealer for it, or I will fill your order, all charges prepaid, to your address at the regular price of \$4.75 each. Please send me your dealer's name. Reference by permission. Editor this Journal.

I-PUTNAM Route 205-B ELMIRA N.Y.

The Schwalge Sectional Incubator

400 to 9600 egg capacity. Single or double deck. New sections may be added within 2 minutes. Every egg chamber holds 200 eggs and is a separate unit.

At the recent Coliseum Poultry Show

we exhibited a machine like the one shown in the above illustration, which was heated up to 103 degrees within three hours after it was set up. Many visitors looked at the thermometers and were amazed at the accuracy and uniformity of the temperature in all egg chambers.

Each Chamber an Independent Unit

and can be controlled separately. Any chamber when not in use can be turned off, thus saving oil. Each chamber holds 200 eggs in two egg trays (holding 100 eggs each), and arranged for pedigree hatching, if desired.

Pure Radiation Heat

Our incubators are heated by pure radiation, thus combining the advantages of the hot air and hot water machines and avoiding the undesirable features of both.

Most Uniform Temperature

The heat to the different egg chambers is controlled before it reaches the chamber (not afterward), which insures the most uniform temperature in all egg chambers.

Ventilation

is distributed over the entire egg chamber (not just in one spot), which is the reason why our incubator is famous for the strong and healthy chicks it hatches.

Moisture Control

Our moisture generator enables the operator to supply any percentage of moisture necessary for good hatching, regardless of surrounding atmospheric conditions, in the most simple, correct and sanitary manner.

Investigate

Before placing your order for an incubator, send for a copy of our catalog and study the unique features of this superb hatching machine.

***All Our Machines Sold Subject to Your Absolute Approval.
Your Decision to Be Supreme; No Arguments.***

THE SCHWALGE-SMITH COMPANY, Elm St., ELMHURST, ILL.

My All Metal VAPORIZER Has More Than Made Good

**What Kind of a
Flame do You Get
This— or This**

Burners equipped with my non-carbonizing all metal vaporizer give an **even flame** and heat **all the time**—while burners equipped with asbestos ring vaporizers become fouled with carbon, burn unevenly, emit smoke and fumes and often go out entirely. Save trouble, time and money by installing a Metal Vaporizer on your burner.

Above illustration shows the five different sizes of Sol Hot Burners. The oil consumption of these burners will range from a pint a day in the Baby Sol Hot to something over a gallon in the No. 5 Heater.

Here we show the parts of my new burner, it's construction simplicity and ease with which it can be taken apart for cleaning and reassembled. Notice the little spreader cap at the right has a plate on top which is adjustable; by means of the screw in the center this cap can be raised and lowered so as to evenly balance the air to both screens which permits burning a larger flame than would be possible without this adjusting cap.

WHEN I announced to poultry raisers some months ago that I had invented a new all-metal vaporizer, one that would not carbonize—one that would burn an even flame **all the time**, I knew it would be "hailed with delight" by all users of oil-burning heaters. I knew that the universal objection among users of wickless oil burners was the asbestos lighters or vaporizers. That is why I finally developed this **all metal** device, after spending years of time and a great deal of money in trying to overcome the many faults of asbestos ring vaporizers by some other means.

My All Metal Vaporizer has more than made good. It entirely overcomes the shortcoming of the asbestos ring vaporizer that so many users have testified was not satisfactory. As every user of a wickless burner with asbestos ring vaporizer knows, the asbestos vaporizer may work all right when new, but it soon becomes fouled and filled with carbon, gets hard and dry as a bone—is hard to start—burns unevenly—smokes and emits fumes, and often goes out entirely.

For the benefit of those who are experiencing the exasperating troubles that asbestos ring vaporizers give, I will send one of my New All Metal Vaporizers by parcel post, prepaid, on receipt of \$1.00. Remember, I absolutely stand back of this vaporizer and guarantee it will do all I claim for it. If after using it 30 days you do not find that it does away with all the usual troubles of asbestos ring vaporizers—does not give you an even flame, steady heat, prove better and more satisfactory in every way, you can send it back and I'll return your money. Furthermore, I guarantee that my vaporizer will increase the efficiency of any wickless oil burner. This All Metal Vaporizer will fit all old style Sol Hot burners and other make burners, excepting those having an oil groove so deep that some sort of wick is necessary. You can start burner easily and quickly with a little gasoline or denatured alcohol, or you can easily start the burner with oil by merely slipping a band of common paper down in the oil groove and up against the vaporizer. The heat from burning paper starts the burner and no trace of the paper is left after the burner becomes fully generated.

Throw away your old troublesome asbestos ring vaporizer—send me a \$1.00 bill, tell me size and make of heater and I'll send you this non-carbonizing All Metal Vaporizer and guarantee that it will end your heater troubles for all time. Remember—

You take no risk—money back if not satisfied

H. M. SHEER CO., Dept. 26 , Quincy, Ill.

My New Improvements Have More Than Made Good

RIGHT now when you are making your plans for brooding this season's chicks is a good time to **investigate** the famous Sol Hot Wickless Oil Heaters—the heaters that **have more than made good**. Sol Hot Heaters for incubators and brooders have been making good for many years and now with my new improvements added this year there is no question of the supremacy of Sol Hot Heaters. Ever since I originated the idea of the first oil heated canopy brooder years ago, the ideas and developments of Sol Hot Heaters have been adopted from time to time, by incubator manufacturers. The principles of the Sol Hot Heaters are recognized among manufacturers as the last word in Wickless Oil Heaters.

My new 1920 improvements have done much to place Sol Hot Heaters well in the lead of all others. The new valve and automatic oil control is one of the features that every user of heaters will instantly recognize as a very convenient and all important one.

With this new valve the oil can be shut off and turned on again without changing in the least the adjustments previously made. The flame can be turned out and re-started as often as desired. The filter is larger and flow of oil to valve on a straight line instead of through a curved tube as used last season. The adjustment screws are in easy reach. This in connection with my new automatic oil control which regulates the flow of oil under all weather conditions and my all metal vaporizer, entirely overcomes all trouble experienced by users of burners not so equipped. They insure big hatches in your incubator—they insure even temperature in your brooder.

Burners without these improvements, while they may burn all right under certain conditions will not vaporize properly when the burner cools off, for instance along toward morning when it gets cold and just at the time when most heat is needed the burner has a tendency to cool off and become filled with raw oil, burns unevenly, smokes and fumes and often goes out entirely.

Sol Hot Heaters with my new late improvements overcome all these disagreeable and disappointing troubles, they completely solve your heating problem in connection with the hatching and brooding of chicks. These heaters are absolutely safe, give off no fumes, odors, gases, soot, or smoke—no wicks to trim. The Automatic Flame Control and the famous Acme Compound Regulator insure uniform heat under all weather conditions.

You'll make no mistake in selecting Sol Hot. My prices are very low considering the quality. If your incubator or brooder is equipped with old style lamps, throw them away and replace them with Sol Hot. It will pay big, you will completely solve your incubator and brooder problems. **We guarantee it.**

This illustration shows how the burner can be lowered and swung to one side without disturbing the position of the oil, fount or altering the oil adjustment regulator.

This illustration shows the new valve and automatic oil control. "A" and "B" show how minimum and maximum of oil flow is secured. When once adjusted no further adjusting is necessary.

Owen Farms Flocks

Stand Pre-eminent

S. C. R. I. Reds

Buff Orpingtons

Nineteen-Twenty was my banner year from every angle. All over the continent and abroad Owen Farms birds in Customers' hands won the highest honors where competition was the keenest. More Owen Farms birds in the trap-nests of customers passed the 250-egg mark than ever before, and several passed the coveted 300 egg mark. The sales of Owen Farms stock and eggs for hatching were the largest that I ever made.

1921 Will Excel the 1920 Records

- Because**—My matings are better than ever before.
- My show plans will be made to suit your convenience.
 - Satisfied customers all over the world are boosting Owen Farms as never before.
 - Your absolute satisfaction is my first thought, and you are insured full value, and a little more, for every dollar you spend with me.
 - Interest in Standardbred poultry is increasing.
 - You will find here choice cocks and cockerels in each of my varieties to head your matings at low prices for their quality, and potential breeding possibilities.
 - You will find here grand hens and pullets in each variety to complete your matings or to be mated with my males to produce the quality chicks you desire.
 - You will find here eggs for hatching that will give you the finest chicks you ever grew.
 - If you will come here and see my flocks you will realize their outstanding quality.
 - If you cannot come, but will write me fully and frankly your exact wants, I will talk with you on paper exactly as I would were you sitting beside me at my desk.

1921 MATINGS

Include the choicest cocks, hens, cockerels and early maturing pullets ever placed together. They will produce the finest average quality and the nearest perfection exhibition specimens ever produced in my varieties. By purchasing eggs here, you will share with me the

chances for producing the finest birds of the year. **Remember**, the birds in my matings include winners at New York, Boston and Syracuse and linebred descendants of the leading winners in my varieties at the greatest shows. My mating list will give you the complete story.

BREEDING BIRDS

300 strong, sturdy, range-grown cockerels that were bred from my finest matings are here to head your matings. Whether you pay \$10, \$15, \$25 or \$35, you will receive exceptional quality for your money. A few choice yearling cocks at \$15 and \$25 each.

You can order directly from this advertisement and will select the exact bird or birds to help you, if you will tell me your strong and weak points. A few fine hens and pullets to complete trios and pens for quality foundation birds.

"Once An Owen Farms Customer, Always An Owen Farms Customer"

Has become a truism. This large, substantial, permanent business has been built up by giving "Golden Rule" treatment. Satisfied customers have always been the best boosters of Owen Farms. Every effort is put forth

here to help you make a success, and the liberal Owen Farms guarantees make your absolute satisfaction a certainty. Write me fully your requirements and receive my complete mating list and a personal letter.

HARD WORK MAKES MASTER BREEDERS

A Constructive and Conscientious Breeder of Rhode Island Reds Tells of the Aims and Ideals of the True Fancier—Great Advances That Have Been Made In the Quality of This Variety. *By Mrs. E. W. Mahood.*

IT has been an immemorial custom of the world to slurringly dub the man of vision "a dreamer" and to extol the so-called practical man. When we ride comfortably in a parlor car or Pullman coach on one of our great railroad lines, we may marvel at the practical ability of those mechanics who are responsible for the smoothly running engine that transports us from one great city to another while we eat, sleep or sit and read comfortably. As we ride along we may stop to reflect on the practical men who manage railway schedules and signal systems so perfectly as to avoid collisions between the swiftly moving trains. This, we say, is what can be accomplished by men with great practical minds. But do we forget the man who saw the vision of the steam engine when others saw no more rapid or comfortable means of traveling on land than in vehicles drawn by horses or oxen? Do we forget the men who dreamed dreams of rapid transit while others contentedly jogged along at the rate of a few miles a day?

We extol the practical enterprise, the endurance, and the great ability for work of our forefathers, the pioneer settlers of America, but forget that they could not have done their work had Columbus not first seen the vision of a great unknown country; and dreamed a dream of sailing the seas till he found it.

When we see a beautiful fowl at a great poultry exhibit, such as is staged annually at the Chicago Coliseum or Madison Square Garden, we commend the skill and practical ability of the man who bred, raised, and conditioned this fowl; but perhaps forget that this fowl would never have been produced had it not been that long ago this breeder saw a vision of just such a beautiful bird, and dreamed a dream of producing it and winning with it at this show.

All honor to the practical man, for he has a remarkable ability! Honor, too, to the dreamer, for he has a great gift! But greater honor to the man who has the gift for seeing visions and the ability to make them live; who has the gift for dreaming dreams and the ability to bring them true.

It is this combination of imagination, breadth of vision, and ability to work out practical details which characterizes the real fancier, the master breeder.

Dreams That Have Come True.

We realize more strongly the truth of this, if we think back nine or ten years and picture for instance Rhode Island Reds as we knew them then. No one at that time but a real fancier who had loved and studied this particular breed could have conceived of them as they are today.

At that time in most back yard and farm flocks, buff and mottled chocolate birds prevailed. The nearest approach to red one could find in such flocks was a few scattered birds of a light shafty bay color, while even in the best flocks there were many buff and chocolate colored culls. Thus even the best flocks in the country, uncultured, showed a woeful lack of uniformity, and it took the eye of a real Red fancier to imagine the beauty which has since been developed from birds which appeared like nothing better than a lot of nondescripts, except to the fancier to whom love, study and enthusiasm give something of prophetic power.

Improvement in Rhode Island Reds.

I remember only three years ago that Mr. Mahood and I showed J. C. Johnston, one of the two or three best judges of Reds in the country, a June hatched flock of 35 Reds of which we were very proud because of their unusual uniformity. Mr. Johnston remarked that if they would all grow as uniform as that, he would not mind raising Reds. Some breeders now have whole flocks which run as uniform as did this small bunch, while in many back yard and farm flocks the buff and chocolate colored birds are now the exception instead of the rule. Mr. Johnston has recently joined the constantly swelling ranks of old time poultry breeders who have taken to breeding Reds.

If the color in Red flocks was varied, nine and ten years ago, the type was no better. Even in the best and most hotly contested shows, one saw birds whose backs tipped like a Dorking's, or curved like a Plymouth Rock's; birds whose bodies hugged the ground like an Orpington, or, scorning the earth, stretched up in the air like a stork. Indeed, you did not have to leave Red alley to find every type pictured in the Standard. Fanciers knew that their most difficult problem was to get good color. Their hearts yearned to possess a really red bird, and what their hearts yearned for, their hands and brains sought to produce. Cruel but unprejudiced judges, however, periodically brought them down from the clouds by consistently refusing to hang ribbons on their cherished beautiful Red Wyandottes, or Red Leghorns, when they could find a bird in the class approaching Rhode Island Red type, with a sufficient amount of good color. Owing to this persistency, we soon began to find better typed Rhode Island Reds, until finally nondescripts masquerading under the name of Reds have almost entirely disappeared from our show rooms. The tipped-back bird, the low-legged bird, the bird whose feet touched the ground, but whose body scorned it, have practically disappeared from our best shows, and birds with the true, beautiful Rhode Island Red type, with level

(Continued on page 236)

MADISON SQUARE GARDEN POULTRY SHOW

The Thirty-Second Annual Exhibition Is a Big Success—Largest Attendance in the History of the Garden Show—The Best Birds Go to New York—Awards and Comment on the Classes.

By F. L. Platt

THE prestige of the Madison Square Garden poultry show is both extraordinary and enormous. The fame of this show is derived from the excellence of the many successful past exhibitions that have been held in the old Garden. The influence and weight of the show are due to the achievements and success of nearly every breeder who has been prominent in the winnings at Madison Square.

It is the show of shows. Standards to which breeders throughout the country breed, and standards that judges study, are made at this show by the living birds which the great breeders of America enter. The uppermost question at all shows is: How does this or that bird compare with what is shown at New York? A chicken is only good by comparison. It is only a remarkably good one until someone puts down a better one alongside of it. And it has come to be generally recognized that the best birds, in the best condition as regards completeness of development and finish of feather, are shown at the Madison Square Garden show in New York City.

Comparatively few of the birds that win at New York are purchased for the show. Take E. B. Thompson, for instance. There is no place that he can go to buy such chickens, and there is one place that he must show his best specimens. If a man with all the money in kingdom-come hired all the judges in America to scour the country for Barred Plymouth Rocks, he could not gather together a line of birds for the Garden show that would possess such surpassing excellence and pronounced uniformity as the Thompson Ringlets. His only hope is to start in and earn his spurs as a breeder. And, he will find that it is easy to get out of the three-minute into the 2:15 class, but as he approaches two minutes he will find that each second and each fraction of a second, comes harder and harder.

It is rash to say that much improvement yet remains to be made by the master breeders of today. They are no longer novices; they are finished artists—a fact that one who walks through the New York show cannot fail to see and understand. The birds that are winning are wonderful models, beautiful in detail, which gives a completeness to their whole set-up; and we despair of being able to describe the wonderful classes with the only tools at our command—words.

This year's exhibition not only contained many

outstanding individuals, but, walk in whatever aisle you would, it was plain that the show was made up of good specimens. The classes of the principal breeds were well filled. In point of fact, the great arena of the Garden was as completely filled with cages as the municipal police and fire departments would permit. Secretary Orr returned over one thousand dollars in entry money to exhibitors who could not be accommodated. Indeed, the wonderful prestige of the Madison Square Garden show was fully reflected in this year's entry, and the confident expectation of another highly successful and triumphant exhibition brought together more great breeders and superior specimens than ever before competed together in a showroom in America.

A Disappointing Delay.

Happy anticipations were mingled with keen disappointment as the breeders began to file into the Prince George Hotel on Monday of show week. The show was to be a day late in starting. Instead of the birds being cooped on Monday and the judging starting on Tuesday morning, the Garden had been leased for a boxing bout for Monday night, and would not be turned over to the Madison Square Garden poultry show until 12:01 a. m., Tuesday morning, Jan. 18, 1921.

This condition threatened to assume the proportions of a calamity in the minds of the exhibitors. Birds had been washed and fitted and shipped; the express companies were ready to make deliveries, but the Garden was not prepared to receive. The lease for the poultry show had been drawn

up for five days starting Tuesday morning. The old gentlemen's agreement of allowing the poultry show, the preceding Monday to get in had been overlooked, and the chickens stayed in their coops in the express cars.

Some of the breeders felt that it was a pure matter of business with Tex Rickard; that he could make more money out of a prize fight in one night than he could out of a poultry show if the latter's contract of five days at \$2,000 a day were extended at the same rental rate for a period of a month. The fact was, however, that Rickard had originally planned to hold his fight the preceding Friday night, when along came Miss Anne Morgan and wanted the Garden for a charity entertainment. Mr. Rickard looked at the calendar and, finding Monday a vacant date, switched his fight to Monday night and let Miss Morgan in on Friday.

Diagram of male, showing different sections. New fanciers will find the show reports highly educational and not so technical if they familiarize themselves with the different sections of a bird.

When he found that the poultry show would be unable to presto, change, and move in within a couple of hours, and was seriously inconvenienced, no one was more sorry than he. He quickly agreed to arrangements whereby the poultry show could keep open until 8 P.M. Sunday, instead of closing Saturday night, and granted the poultry show all day Monday to get out. In the words of Secretary Orr, "Don't criticize Rickard; he is with us."

During the delay and opening day, D. Lincoln Orr, secretary and manager of the Garden poultry show, kept his head up and swam hard. He spent \$100 telegraphing to breeders, but he did not reach them all. Ferris had shipped his White Leghorns on the preceding Friday. Chapman, as near by as Trenton, N. J., had not learned of the difficulties and started his string to New York in a truck on Monday morning. Delano received his wire, so delayed starting until Monday, which would put him in New York on Tuesday. On Monday, however, a severe storm blew up off the coast, and the boat from Martha's Vineyard to the mainland was unable to put to sea. Delano chartered a 51-foot schooner and with the birds started across the choppy channel for Wood's Hole, on the southern coast of Massachusetts. After standing still for three hours against the tide and a fifty-mile gale, two hours of headway against the waves brought them into dock at mainland at 6:30 o'clock in the evening. The last train for Boston had left, and there was no alternative except to hire two big automobile trucks to make the run to Boston with the birds during the night. It was an expensive proposition and a disappointing one, for the cold wave that had swept down over the eastern Atlantic states nipped the combs of his White Leghorn males during the long hours of exposure, and they came into New York with frosted combs. Frank Davey applied tincture of benzoin and kept down the swelling.

The breeders as a whole, during the delay in cooperating the show, displayed the gentlemanly courage of true fanciers. There was

sympathy rather than criticism for the management, and scarcely anyone offered the fact that he was unduly handicapped as an alibi for why he did not win.

The show was exactly one day late. Precisely at 12:01 A.M. Tuesday morning Manager Orr put forty men to work in the Garden, and they were on double time for night work. The prize ring was torn down and the thousands of seats taken out. Then Spratts threw thirty picked men onto the job of setting up the benches and cages. By 7 A.M. Tuesday morning the Garden had been cleared and the cages in the arena were up. By noon half the birds were in their coops. All that now remained to be done was to widen out the balconies over the box seats, covering the box seats from view, and making a big balcony completely around the amphitheater for the pigeons and bantams. By Tuesday night practically all of the birds were in their places in the show, and the judging started Wednesday morning, just one day late.

Unfortunately, there was not time to take out the false

floor that had been built for the fight. The floor declined from both ends to the center, where the ring had been erected. This pitch in the floor was not decidedly pronounced, as far as a single bird in an individual coop was concerned, yet it was conspicuous when the show was viewed as a whole.

The attendance was tremendous. At 3 o'clock on Wednesday afternoon Harvey Wood remarked: "Watch the crowd. We have opened the second ticket selling window for the first time in the history of the Madison Square Garden poultry show." On Thursday afternoon he said: "We have caught up for the missed day." The paid admissions on Thursday were 5,823. This compares with 4,975 paid admissions on Thursday of the 1920 show and 2,200 on Thursday of 1919. The admission to the Garden poultry show is \$1 plus 10 cents war tax. The attendance continued to roll up in unprecedented fashion all day Friday and Saturday. If two men stopped in an aisle to inspect a chicken, there was immediately a congestion of traffic, so many were the people on the floor.

The interested public that paid admission to the show saw Standardbred poultry. The show was a breeder's show. There were no sales pens filled with high tailed, coarse combed Leghorns in the center of the arena. The public saw birds that were entered in competition. Those who wanted to exploit the public with sales birds, utility types and so on, were consigned to a sales class, which was in charge of a superintendent and was located downstairs.

Sidelights on the Show.

The educational program, which was under the direction of Harry M. Lamont of the U. S. Department of Agriculture, was also held downstairs. Here lectures were given continuously from 2 to 5:30 afternoons and 7:30 to 9:30 evenings. A great variety of subjects were handled by recognized leaders and authorities in the industry, and their lectures were well attended. No extra charge made for lectures.

Waterfowl and turkeys were cooped on the lower level. Roy E. Pardee, who superintended this department, spoke of these classes as containing speci-

mens of "unusual quality, which, coupled with entries three times as big as last year, drew the crowds downstairs." Mr. Pardee further stated: "The increasing interest shown in ducks and geese, which has been manifest during the past year, resulted in 114 entries of ducks and 76 of geese, practically all varieties being represented."

Cornell University had its usual exhibit in the restaurant room. We were impressed with the White Leghorn females that this institution displayed, for they appeared to have been selected for quality and came nearer to conforming to the Standard than the hens that have heretofore been exhibited by the New York state college.

The White Leghorn females that Harry Lamont puts down in the U. S. Department of Agriculture exhibit are examples of what can be done in the way of combining Standard and utility quality. The cockerels that are dammed by these hens, and the cockerels that are brothers to these pullets, have fine heads, and backs that sweep with (Continued on page 218a)

Producing Strongly Fertile Hatching Eggs

Some Established Facts and Some Old Fancies Science Has Disproved—
Females Rather Than Males Are Usually to Blame For Poor Fertility—
Value of Exercise for the Laying Hens.

By T. S. Townsley

WHETHER eggs hatch well or not depends pretty much on the percentage of fertility. If better than 90 percent of the eggs are fertile, the hatch runs a strong chance of being a good one. Something might step in to spoil the hatch, such as an old thermometer in the incubator which failed to register the correct temperature, but with good fertility the poultryman has every reason to expect his chicks to hatch out like corn popping. On the other hand, poor fertility always means a poor hatch, no matter if the eggs are carefully and properly incubated.

Poor fertility is always a disappointment. It means low hatches, a waste of eggs and delay in getting out the desired number of chicks. Some method of determining whether or not the eggs are fertile before they are set would be a great boon to the poultry industry. The need for such knowledge has led to much speculation on the subject and has given rise to a variety of theories, and to the invention of many so-called testers.

In spite of all the thought given to the subject by man, nature has failed to reveal any plan by which fertility can be determined except after the egg has been incubated for a few days. Therefore, the chief thought of the poultryman must be given to the factors which cause good and poor fertility.

Factors That Contribute to Good Fertility.

On the farm where the hens are given free range and are not forced for egg production poor fertility is seldom a problem. It is by no means rare for eggs from farm flocks to show 100 percent fertility under hens and to show more than 90 eggs fertile out of each 100 set in incubators. The greatest complaints about poor fertility usually come from intensive plants where the birds are given limited range and are expected to lay during most of the year.

These facts have given rise to many theories in regard to the cause of poor fertility. It is commonly claimed that close confinement, heavy laying, breeding from pullets, lack of green food, too few males, and heavy protein feeding are causes of a high percent of infertility. Most of these factors have not been studied as carefully as the subject deserves but the available data indicates that some of these theories are founded on fancies rather than facts.

Investigators generally agree that lack of exercise is likely to result in low fertility. This is the general experience of backyard poultry keepers and of those who keep hens under intensive conditions.

The West Virginia experiment station reports a test with White Leghorns in which free range hens laid 91 percent fertile eggs while a similar lot confined to a small run gave only 75 percent fertility.

Many poultry keepers do not feed an egg ration during the winter months, claiming that heavy laying before the breeding season will injure the hatching qualities of the eggs. That such a notion is a fallacy as far as fertility is concerned is the opinion of many investigators. The matter is summarized as follows in Bulletin No. 168, issued by the Maine Experiment station:

"The present statistics indicate that there is no correlation

whatever between winter egg production and the fertility of eggs laid during the subsequent hatching season. In other words, the eggs of the heavy winter layers are not more likely, on the average, to be less fertile than are those of the light winter layers, other conditions being the same."

The Maine Experiment Station has also shown that eggs from hens are not superior to those from pullets in percent of fertility.

Feeding tests at the Purdue Experiment Station show that eggs from hens fed milk, meat scrap, fish scrap, or no animal protein, showed practically the same percent of fertility, though there was a marked difference in the total number of eggs laid. The bird that received no animal protein did not lay as many eggs.

Experiments on colorless rations at the University of Missouri have shown that hens on a ration devoid of green food laid eggs that were highly fertile.

Number of Males Needed to Produce Good Fertility.

The proper number of hens to be mated to each male is a much debated question. The common practice is to provide one rooster for each ten or fifteen females. In view of recent studies on the mating habits of fowls it does not appear probable that poor fertility is very often caused by an insufficient number of males. In tests made by the writer with White

Leghorns it was found that one union of the sexes produced fertile eggs for an average period of eight days, and that vigorous White Leghorn males make at least twenty-five matings daily. In practical tests at the University of Missouri, two White Leghorn males penned with 85 hens have been sufficient to give excellent fertility.

Complaints of poor fertility comes most frequently in the early spring and it is probable that weather conditions often have an influence. Professor Lewis of New Jersey has shown that birds with badly frosted head-parts lay eggs of poor fertility. It is also known that in cold weather the fertile egg is

often chilled so that the embryo does not develop, thus causing the egg to show as infertile. No doubt much of the trouble from a low percent of fertility during February and March is caused by careless handling of the eggs between the time they are hatched and the date of setting. Any temperature below 35 degrees is likely to kill the fertility of an egg while a temperature of above 80 degrees will cause the embryo to start developing. In many cases the eggs are kept in a warm room during the day time where embryonic development takes place while the temperature goes so low at night that the egg is seriously chilled.

On cold days eggs intended for hatching should be gathered every two or three hours to prevent chilling in the nest and should be stored in the basement or some other place where the temperature is uniform and moderate. Prof. A. G. Phillips has shown that eggs kept at a temperature of 50 degrees showed stronger germs than those held at 65 degrees, while eggs kept for 14 days showed very poor fertility.

Do Not Always Blame the Males.

The individuality of the female undoubtedly has a great influence on the percent of fertility. In trapnesting and pedigree stock it is found that some hens regularly lay eggs

Free Range Hens Give High Fertility.

that are very highly fertile while others lay eggs that are constantly infertile. This variation appears to be entirely independent of the character of the male bird with which they are mated. In observations made by the writer with White Leghorns he found a decided difference in the mating habits of different hens. Some hens regularly mated several times daily, while others mated only once, and some not at all. The number of matings for each individual hen was fairly constant day after day.

Once in a long while a rooster is found that gives poor fertility but this is a very rare occurrence where cockerels are used and due attention is paid to selecting vigorous individuals. Where birds are closely confined, two or more males

in the same pen often waste their strength in fighting, so that much poorer fertility results than where one male is mated with a large group of hens.

In some of the breeds having large fluffs as Brahmas and Wyandottes poor fertility often results from a physical difficulty which can be remedied by clipping the fluff feathers of both males and females.

The fertility problem deserves further study by experimenters, but the present information on the subject indicates that lack of exercise for breeding stock, careless handling of hatching eggs in cold weather, and the individuality of the hen are the principal causes of low fertility in eggs set.

FEED AND CARE OF BABY CHICKS

Do Not Rush the Babies Out of the Incubator Too Soon—Adequate Heat in the Brooder Is the First Requirement—What and How To Feed During First Three Weeks.

By Willard C. Thompson

WHAT more pleasing sight is there for the real chicken man than a flock of healthy, growing chicks? While there is a big job at hand for the poultry raiser when, after three weeks of incubation, the chicks burst from their shells and hatch, the beauty of the job is that if it is well done the results will more than justify the time and effort. It is in the early spring that our attention is focused on this job, and February days are good times to consider some of the points in the care and treatment of the new-born chicks.

While Yet in the Incubator.

The baby chick hatches out of the shell and spends a couple of days in the chamber of the incubator. That is a most critical time. It is at this stage that conditions surrounding the chick should be carefully planned and managed. The writer is of the opinion that on the twentieth day of incubation, the chamber of the machine should be darkened by tacking papers or cloths over the front glass windows of the incubator. If this is done, the newly hatched baby chicks will not crowd toward the front of the chamber as they get onto their feet.

If allowed to push their way toward the front of the machine they are apt to smother the younger chicks and overhear each other. Anyway Nature intended that the newly hatched chick should rest for something like a day's time, before moving about very much. In a dark chamber-tray the chicks remain approximately in the spot where they hatched, and they sleep for several hours, or until thoroughly dried off, and until the little legs are strengthened.

Baby chicks are quite apt to pick at anything which is on the floor of the trays, and therefore when tiny bits of droppings come in view, chicks pick at them. This is the way bacillary white diarrhea is spread among baby chicks. In a dark hatching chamber this does not happen.

The incubator hatching tray and chamber should not only be darkened, but should be sanitary and clean, free from down of previous hatches and all old droppings, etc. This means that before the eggs were entrusted to the machine the chamber should have been thoroughly disinfected with a five percent solution of some coal tar disinfectant.

Allow the baby chicks to remain in the egg chamber until the youngest of them is dried and up on its feet. This will mean that the majority of the chicks will be about thirty-six hours old, and it will do no harm if they are kept there an extra twelve hours. The chicks should be looked at from

time to time and not kept in the machines too long, as they may become weakened, especially if the hatch is good and the trays are crowded.

Removing to the Brooder.

Along in the afternoon, as soon as the brooders have been prepared and are warm and ready for the chicks, the incubators can be opened and the youngsters removed. Just at this point there is one thing that should receive serious consideration:

As the baby chicks are being handled in transfer from the trays to the brooders, begin the systematic process of culling and selection, which should be a part of the management throughout the year on every poultry farm. Every baby chick that passes inspection should: (a) be standing squarely and strongly on its feet, (b) be completely dried off and well fluffed out, (c) be well formed, not crippled in any way, and (d) be of good size and vigor. Weaklings can better be killed and disposed of than carried along in the brooders, only to die later on after having been an expense. It is sometimes hard to throw out a chick that does not hardly measure up to a severe standard, but it is good business, especially if we are building up a line of birds that excel in constitutional strength and vigor.

In our own practice we now go to the trouble of dropping a drop or so of sour milk down the throat, using a medicine dropper or fountain pen filler. This takes but a moment extra time, but it establishes in each chick an appetite for the sour milk, a liquid

with considerable food value which helps to "make" the chick during the first few weeks of life.

Then convey the baby chicks from the incubator place to the brooder house in a warm, protected carrier. Chilling at this critical point is more common than many people suppose, and results in the chicks developing digestive trouble in about one week.

Have the Brooder Ready.

Two or three days before it is expected that the chicks will be ready for the transfer, the brooders should be cleaned, sprayed and the heat started, so that they will have been in perfect running order for at least twelve hours before the chicks are put in. It is never safe to gamble on a brooder stove working without a hitch just because it did so last year. Test it by running it a few hours before the chicks are placed under its care. The motherless chicks need heat and a constant supply of it, and there must be no uncertainty of heat supply if the chicks are to grow

(Continued on page 217)

Nature Has Done Her Part—It Is Now Up to the Grower to Develop Them.

THE GREAT BOSTON SHOW

3, 900 Head of Poultry Competed for the Honors—Exhibition Well Attended By the Public—One Sale of \$3,200 Made—Full Awards and Comments On the Classes.

By F. L. Platt

DURING the week of December 28, 1920, to January 1, 1921, the Boston Poultry Association held an annual poultry exhibition that befitted the City of Traditions. It was in Boston, more than seventy years ago, that the first poultry show in the New World was held. It was New England that rocked the cradle of purebred poultry in America. And we of the west who traveled east to attend the Boston show this year went as pilgrims to the shrine of nativity.

The Boston show of December, 1920, was named to celebrate the three hundredth anniversary of the landing of the Pilgrim fathers in Plymouth, Mass. The ideals and customs of those early founders of the New England states have had a great influence upon America. And as the sons of the Pilgrims multiplied and advanced and spread westward, peopling the nation, so the breeds of poultry that New England received from the Old World, together with those newer breeds that were made up by the genius of New England breeders, have become the common, established types of fowls across the continent westward to the Golden Gate where the sun lingers at eventide before it drops below the waves of the Pacific.

A high type of New England gentlemen officer and participate in the Boston poultry show. The president of the Boston Poultry Association is John Lowell, who is a cousin of A. Lawrence Lowell, president of Harvard University. Among the exhibitors are included men of the oldest families, such as Robert Treat Paine, a direct descendant of an early statesman of the same name, who was one of the signers of the Declaration of Independence.

The Boston show is held in Mechanics building, which is located on Huntington avenue. It is a large building with two great halls, and was erected by the Massachusetts Charitable Mechanics' Association, of which the first president was Paul Revere, a Revolutionary soldier, famous for his midnight ride from Boston to Lexington, to warn the militia of the approach of British soldiers.

There is fine light in Mechanics building. Sometimes there is a London fog in Boston, but the weather during the week was as warm and bright as spring, and on the day of judging, in the fine light in the halls, every defect of the poultry yard stood out in bold relief. The judges did not have to resort to carrying the birds to windows, or to guesswork.

A Good Entry.

There were about 3,900 head of poultry in competition. This does not include the display pens, which are more numerous at Boston than anywhere else, or the pigeons, etc. In addition, there were 350 birds in competition in the juvenile class. The Boys' and Girls' Club show brought out some very nice birds, a number of the specimens being worth \$25 each. As a whole, this class was quite free from inferior wasters. The boys and girls paid the express on their birds, but no entry fee was charged. The birds were judged by an assistant from the State College of Agriculture, and he demonstrated that he had an eye for a chicken.

Secretary W. B. Atherton was more than pleased with the entry. Said he: "Last year we held the seventieth anniversary Boston show, celebrating the first poultry show every held in America, and we worked hard for entries, making special inducements to specialty clubs to hold their meets at Boston. We wanted to hold the big-

gest show ever cooped in Boston, and we did. However, the show was really too big; the aisles were only four feet wide and crowded. This year we did not make the same strenuous effort to get entries, yet of poultry in competition we are only 250 short of last year. We are a thousand ahead of 1919. Next year we will hold another record-breaker. The Red Club will be with us and is raising a thousand dollars for special prizes. The Cornish Club is coming, and Mr. Borher tells me that they will put down 400 Cornish at Boston. I think that our show this year is the best balanced we ever held."

Secretary Atherton gives a great deal of personal service to his show. An exhibitor who has but one entry and who has the most trivial matter on his mind can always reach the genial Billy Atherton. "Well, that is the way I want to have it; that is the way I want to do. I want to keep in personal touch and know as minutely as possible what is going on. I believe it creates more interest in the show, and I know I take a keener personal interest in the show."

Continuing, Mr. Atherton said: "There have been more sales this year than last. One lot of Reds were sold for the Garden at \$3,200. The attendance is good. On Tuesday, our first day, we were three dollars short at the gate as compared with Tuesday of last year. Wednesday, the second day, we were ten dollars ahead of Wednesday of last year. General business conditions throughout New England are worse than they have been in many years, yet the interest of the public in good poultry is as great as last year when money was freer. I appreciate the loyalty of the fanciers of the country in supporting the Boston show as they do with their splendid entries."

Care of the Exhibits.

Boston is a remarkably well fed and a remarkably clean show. The cages are furnished and put up by Spratts. The feeding, watering and cooping of the birds are done by John Kriner of Pennsylvania. He has six men who feed and water, coop and uncoop. They are liberal feeders, too. The first feed after the birds arrived amounted to fourteen and a half bags of one hundred pounds each. Each feeding after that required about half as much. In all, the birds consumed about four and a half tons of feed during the show.

The coops are bedded before the birds are put in. The feed and water cups are filled and grit is put in each coop. As soon as the judging is finished, the birds are bedded all over again. Then, every morning, coops here and there are filled in where the birds have spilled their water or scratched the shavings out of the cage onto the floor. The last day of the show about seven bales of shavings were required. The result is that the Boston show smells as sweet and looks as clean on Saturday as on Tuesday. Four men spend their time sweeping the shavings from the aisles. That is all that they do, sweep one aisle after another, and then go back to the starting point. There are no shipping coops under the benches. These are all carried downstairs. Nine men are picked up to carry coops downstairs, and then at the end of the show this rough labor is again picked up to bring the coops back. Throughout the show, John Kriner walks the floor continually, all day, and if there is anything wrong, he quickly calls attention to it.

The next Boston show will be held January 2-6, 1922.

The Asiatics.

Light Brahmas—Willow Brook Farm, Beverly, Mass., 1-3 cock, 1-3-4 hen, 3 ckl, 2 old pen, 4 young pen; Harvey C. Wood, Bound Brook, N. J., 2-5 cock, 2 hen, 1 ckl, 1-2-5 young pen, 1 old pen; Rambleton Farms, Buzzard Bay, Mass., 4 cock, 3-4-5 pl; Fairview Poultry Farm, South Portland, Me., 5 hen, 2-5 ckl, 1-2 pl, 3 young pen; Fred S. Barton, Norwood, Mass., 4 ckl; George V. Fletcher, Belmont, Mass., 3 old pen; Willow Dale Poultry Farm, East Weymouth, Mass., 4 old pen.

In Light Brahmas there were 14 cocks, 15 hens, 22 cockerels, 18 pullets, 11 pens.

Drevenstedt has done much for the Brahmas in the last few years since he has judged the classes. He has put new life into the birds and new interest into the breed. The sluggish, squatty, short-legged Brahmas of New England, which at one time were characteristic of the Boston show, are absent.

The class started off this year with a cock in coop No. 1 that weighed fourteen pounds. He was not awarded a ribbon, but he did attract much attention among visitors, who saw this great big bird as they entered the Brahma aisle. First cock belonged to the same exhibitor; big, broad back, big body, good Brahma type; neatly ticked in saddle, sound tail, nice bar of slate in under color that runs to white at base, bluish under color in breast and body, practically no black on the breast at shoulder or throat; laced hackle that comes clear around in front like a collar. Second cock, heavier marked, black coming to surface at shoulders and in upper breast near throat; not as white in surface color as 1st cock.

First hen, not an outstanding bird. Second hen, a truly great Brahma hen, beautiful white body color, good eye, skull and comb; nice broad feather in hackle with velvet black center; trifle too wide white edging on hackle. Hens with small individual feathers in hackle do not win as well.

First cockerel, on lines of 2d cock; of same line of breeding. Second cockerel, a snappy colored bird, good style, back stripe a little heavy. Dreve. does not go in for coarse, sluggish birds. Third cockerel, nearly bare middle toes, bad hackle.

First pullet, like 2d hen, clean back and body surface, double row of tail coverts, beautiful hackle, with remarkably broad neck feathers for a pullet. Needless to say, perfect wings, for birds must carry wings to be considered in such a class. Second pullet young; neck like velvet. All pullets under ribbons characterized by good heads, combs, wings, tail coverts, sound hackles, white surface of back and body.

Such Brahmas as win at Boston can be counted on as good layers and to give good fertility. Dreve. picks males that hold up tails and have good life. Perhaps they do not make the biggest, but they make the best Brahmas. Winner of 1st cockerel last year told of sixteen hens of which only one set last spring and whose eggs averaged eight chicks to the setting throughout the season.

Drevenstedt broke an all too long established policy of

awarding specials on Brahmas at Boston to birds in single classes. He gave best bird special to 1st young pen male, a wonderful bird in every way except shy on middle toe feathering.

Dark Brahmas—John W. Shonfield, East Lynn, Mass., 4 cock, 2-4 hen, 3-5 ckl, 1 pl, 1 young pen; Willow Brook Farm, 2-3-5 cock, 1 ckl, 2-4-5 pl, 2 young pen, 1 old pen; Fred F. Field, Montello, Mass., 1 cock; Dr. S. Lott, Waterloo, N. Y., 1-3 hen; W. E. Poch, Chelsea, Mass., 5 hen; E. H. Balsakos, East Lynn, Mass., 2 ckl, 3 pl; Charles W. MacNear & Son, Ashland, Mass., 4 ckl.

Secretary Atherton was much gratified as a result of renewed interest in what he termed "real New England breeds." He referred to the classes of Light and Dark Brahmas. There hadn't been such a class of Darks seen in many years—6 cocks, 6 hens, 9 cockerels, 14 pullets, 5 pens. We have never before seen such an array of good

Dark cocks. First cock, best of type. Good size in 4th. Wonderful toe feather in 3d. Not a brassy cock in the lot. If with the size of 4th, long feather could be grown, such as Adolph Anderson told of Captain Pease having twenty-seven years ago, the breed would be on its old footing. On the other hand, Drevenstedt says that it is human to magnify the past, and in his opinion the Darks at Boston this year probably were as good as ever grew. The class was a revelation. Interest was aroused and several breeders were in the market for good ones.

First Dark hen a larger bird than 1st Light Brahma hen. Truly astonishing; she was beautifully penciled all over, although ground color is not as clear white as Anderson says they had years ago when Dark Brahma classes were a feature of the shows.

Only one cockerel had the mottled breast of a pullet breeder. First cockerel a sensation; elegant silvery white ground color on top, clean-cut striping in neck and back, solid black breast, tail and body, and scarcely any gray in toe feathering; good head, clean white wing bow, sound black wing bar;

under color, cotton. We hope that the undercolor bugbear is kept out of the rejuvenated Dark Brahmas.

Pullets, a hard class in which to select the winners. Many mossy backs. Perhaps the old-timers would have thrown these pullets into a molt and got new plumage on them. A penciled pullet is always better as a hen with hen plumage. First pullet about the best color, but bare middle toes and Wyandotte type.

Buff Brahmas—F. J. Hochrein, Greenfield, Mass., 1 cock, 1-3-4 hen, 1 ckl, 2 pl; H. C. Merrill, Malden, Mass., 2 cock, 2-3 ckl, 1-3 pl; William B. Sanborn, Medford, Mass., 2 hen, 5 ckl, 4 pl; D. C. Johnson, Malden, Mass., 4 ckl.

Buff Brahmas have been something of a standing joke until this year, when four breeders showed and the class attracted attention. First hen, a good buff hen with Light Brahma markings. First cock had a few admirers for black points and level shade of ground color; however, lacked size. First pullet, soft buff, elegant hackle, two rows of tail coverts, pretty good wings, although not like a Light Brahma; slate under color running light at the base, no black show-

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

There Come Times of Test

This editorial is about the loss of some valuable birds. Nearly every breeder has experienced, at one time or another, the loss of perhaps one such bird. He knows that should wind or fire destroy a poultry house another can be built to take its place, but when the vital fire of a living fowl burns dimly until at last some vital function fails and death ensues, the specimen is gone, and with it all the seed of its posterity; and the silver thread of pedigree that runs from generation to generation is broken.

Good fanciers regret the loss of a single sturdy chick which was well bred and which might have developed into something worth while; and most of them are not unfamiliar with that keener disappointment which sometimes amounts to a discouragement that sinks deep into a man's being, when a bird is lost after it has been grown with pride and fascination as it developed certain desirable qualities that gave promise, if only they could be reproduced, of improving the quality of the strain and helping the breeder to get ahead. More than once, perhaps, have a fancier's hopes died with his favorite bird.

There are, of course, poultry keepers who do not look on their chickens as individuals. They number their birds as a dozen, or eighty, or twelve hundred. With them an individual fowl is only one or more or one less unit; and the loss of a specimen is merely a matter of record keeping, a hole in the ground and some kerosene with which to burn the carcass.

On the other hand, the constructive breeder knows his birds individually; he sees them in his dreams, and pictures of their sires and dams, grandsires and grandams, hang on the wall of memory. To him one bird is worth \$10 and another one is worth \$100. It is, indeed, difficult for him to put a price on his best specimens. Just recently Frank Rogers was offered \$150 for a White Leghorn male and he declined to part with the bird. The buyer thought that if Rogers had the money in his pocket it would be hard for him to send it back, especially after purchasing a new farm,

so he forwarded a check for \$150, and Mr. Rogers mailed it back. It is said that after Wm. Ellery Bright returned home from the Chicago show, his poultryman, Dudley Coakley, received an offer of \$500 for one of the Brown Leghorn males that they had on exhibition at the Coliseum; and Coakley telegraphed Bright asking if he should sell, and the telegram went unanswered.

What a tremendous and irreparable loss when a breeder's best productions, the tops of his flock, are wiped out! That is what has twice happened to Geo. W. Mitchell. Last year ten of his Partridge Cochins, including his 1st and 2d cocks at Boston, were smothered en route home from the Boston Show. That was enough to have taken the enthusiasm out of a younger man with many years of opportunity before him, but for an old man who had worked for forty years to produce those elegant Cchins, it took some hardihood to face the loss of his best birds and say "all our plans are to produce still better quality."

He again entered at Boston this year. He wanted to show that he could come back, that his line could recuperate its quality, but of the thirty-four birds that he shipped to Boston, eleven were smothered in transit. These included the 1st, 2d and 3d pullets of last year which were now hens, and a grand cock. When Adolph Anderson, who has been associated with Mr. Mitchell for the last twenty-five years, pulled out the dead cock, tears were in his eyes. He called Mr. Mitchell on the long distance telephone that evening, and then, setting down in the lobby of the hotel, said: "We cannot go on; there is a limit to the losses that any breeding yard can stand."

Mr. Mitchell was in Boston the next day. He remarked that he had not slept much the night before, that he had laid awake until morning running over in his mind the birds that they had left which were available for breeding, and that he had recalled carefully their pedigrees and thought out possible matings. He then stated: "We will go on. We will be a little handicapped. We will not be able to grow as many birds as we would like to, but I think that it is always true that some of the best breeding birds stay at home, for

they are not always the best show birds, and I believe that we can preserve our strain regardless of the disasters that have overtaken us."

In this example of carrying on, Mr. Mitchell shows the indomitable spirit of a great fancier; and he will be remembered when many other present-day breeders are forgotten; for it is not the prizes that are won, or the money that is made, but the example that is set that is remembered.

The successful breeding operations and courage of Geo. W. Mitchell will, for many years to come, be an inspiration to fanciers all over the country whenever true stories of his life are told.

As a young man he began breeding Partridge Cochins. The variety was man-made. There was nothing just like it until Wm. H. Brackett, cashier of the Merchants National Bank of Boston, produced the first Partridge colored Cochins in the seventies of the last century. Mr. Mitchell took up the variety shortly after that, and in the eighties exhibited in a class of about 200 Partridge Cochins at the Indianapolis show, where he won largely, because the color of his birds excelled the western birds.

The shape possessed by Partridge Cochins in those days was not all that he wished. The Buff Cochins excelled in length of feather, roundness of form, and they had more of the crouching, tipping-forward carriage that all Cochin men so much admire. Mr. Mitchell added a pen of high class Buff Cochins to his yards. Only on one or two occasions did he ever exhibit any of the Buffs. He kept them to study. They were the models in this artist-breeders' studio. He observed particularly that the feathering on their shanks was so full that when a bird faced him forward, he could not see the bare inside shank. He started in to duplicate this feathering in his Partridges, and his birds are today the equal in feathering of any Buff Cochins in this country.

Twenty-five years ago he decided that the system of breeding Partridge color was wrong. He felt that the highest art in breeding would not be attained until the same family of birds would produce the highest type of both males and females; and that a variety that was split in two by double mating, one family to produce exhibition males and another family of birds to produce exhibition females, was not a true variety. He then launched out, against the advice of all the prominent judges and breeders of the day, on his now famous career as a single mater.

The penciling of his females and the color of his males are among the most marvelous things to be found in any strain of purebred poultry today. He has not always followed the Standard, for the Standard has at times been wrong. He has been producing models for Standard makers to study and interpret.

Just as he felt years ago, that dark undercolor would be the ruin of the variety, as it proved to be, so he feels now that breeders of Partridge Wyandottes and Partridge Plymouth Rocks are in error in demanding a level shade of red ground color in their males hackles, wing bows, backs and saddles matching. The tone of color on his males is highly accentuated over wing bows and backs; the hackles and saddles being of a lighter shade of red color.

There is growing tendency among breeders of the present generation to require a level color in all varieties. Some of the males of the older breeds, like the Black Breasted Red Game Bantams, have a two-color effect, the wing bows and back being richer in color than the hackle and saddle. This combination is not less beautiful than the present-day fashion of level color; and before we set a level shade of color, all sections matching, as the uncompromising law of absolute perfection in the Partridge varieties, let us give ear to the counsel of an old master. Says Mr. Mitchell: "If you want to breed by Standard matings, and I take it that that should be the aim of all breeders, your females will come smoky if your male is as dark in hackle and saddle as in wing bows and back, and if the wing bows and backs of the male are as light in color as his hackle and saddle, the females that he sires will be too light."

Mr. Mitchell defines the correct color-type for a Partridge male as a "happy blending of colors rather than a continua-

tion of color." He has studied colors as an artist and although he cannot paint with a brush, he has blended the red and black of this variety into a brilliant, contrasting combination. He does not think it possible to reduce to Standard terms these ideal color effects. As it is necessary for the young artist to study the paintings of the masters, so he thinks it necessary for one to see the living fowls with their marvelous coat of plumage. Strange as it may seem, this breeder believes that one color effect in one fowl may look good and a slightly different tone of color on another fowl may look as good and be as near ideal. It is in the proper blending of colors that he lays emphasis, and he holds that they must be seen to be understood.

Where does he get his color from? It is a different red than any other Partridge breeder has. There is a story that has been told of this same question having been asked about a great artist, and search was made in all his pots and crucibles, but not until after he was dead was it found that his red color had come from an old wound on his left side. No doubt about it, when a man puts his heart into his work, he gets a richer color and produces a deeper effect. No one will succeed in reducing to words the exact colors of the Mitchell Cochins and the secret of their color will be found in their breeder's devotion to the study of the problems of mating and growing. In his own words, he has put his "whole being into the work."

Still much that he has done has been done under handicaps. For instance, his place is only 150 feet by 297 feet, and the famous Cochins are grown on a patch of ground 40 by 100 feet.

Let those who hesitate because they haven't room, or haven't birds good enough, or haven't time in which to accomplish that which they would like to accomplish, find inspiration in the achievements of this man who has but little room, who has not the best birds because the best are dead, and who no longer has much time in which to breed for he is close to seventy-two years of age—and still he aspires to put into Boston next year better Partridge Cochins than the world has yet seen.

Dignifying a Basic Industry

Governor Calvin Coolidge of Massachusetts, who is soon to be inaugurated as Vice President of the United States, visited the Boston Poultry Show on Thursday, Dec. 30, where he met the veteran fanciers, who are annually banqueted as the guests of the Boston Poultry Association, looked over the classes of birds that were on exhibition, and shook hands with several of his friends who are numbered among the poultry breeders of New England.

The questions that be asked were those of a practical farmer who was interested in prizes not as the mere rewards given to the successful players of a game, but interested in prizes as the tokens awarded to men who are producing the best types of seed-stock for a great basic industry. Governor Coolidge did not refer to poultry as "the poultry game," but as "the poultry industry." He has a knowledge of and a personal interest in the problems of the breeder, and his attendance at the Boston Show was his mark of appreciation for the constructive work of the improvers of our poultry stock and breeds.

This recognition of the work of the breeder, from the head of a great commonwealth, is a progressive attitude for public leaders to take. It is in line with the attitude of statesmen in Britain.

The reigning heads of England, Queen Victoria, King Edward and King George, have each in turn taken a personal interest in the problems of live stock production from the standpoint of the purebred breeder. Just recently a picture was reproduced in this country showing King George standing amidst the cattle at the Smithfield Fat Stock Show. Commenting on this picture of the King, the Breeders' Gazette said:

Peers of the realm, great landed proprietors and those who control the British metropolitan press, falling in line, leave nothing undone to demonstrate a like concern as to the empire's agricultural welfare. No nobleman's country-seat is complete without its pedigree animals, and when a Royal or a Smithfield show is held, not only do the great men of the country grace it by their presence daily, but newspapers

print columns of well-written descriptions of the events from the pens of experts.

The whole tendency in America is to educate people away from the land. The city editors and cartoonists still crack their ancient jokes about bewhiskered "Reubens." Anything to make the farmer's calling appear ridiculous and unworthy, and thus help to drive ambitious young men of farm birth into law offices or big "business" organizations.

The point is just here: that which is regarded as a calling worthy of the best thought and personal attention of the highest in Britain, is, in this country, too often the mere sport of speculators, and, from the standpoint of many public men, a business to be left to a few countrymen whose operations "do not count for much anyhow" in the national economy. The Gazette denounces as monstrous this belittling, this ignoring by the American public and American public men of what ought to be recognized as our one best, most dignified and most essential basic business.

Writing Show Reports.

"Mind your own business" is an old adage and a good one. Successful men have, as a rule, followed it. But anyone who attempts to write a show report soon finds that he is minding the other fellow's business.

It isn't pleasant to criticize. It is like spanking your own baby. It hurts you more inwardly than it hurts him outwardly.

The show reporter who sees only the good, and overlooks the bad, has a whole lot more peace of mind than the conscientious reviewer whose conception of fairness is justice. It is stern business to mete out justice.

Perhaps, in writing the show reports this year, we have overestimated our obligation to the reader; perhaps we have told too many tales out of school; but the old style show report was too much like a series of "free readers," and it has seemed to us that the time

had arrived when someone should have the hardihood to portray with truer accuracy the real merits of the winning birds.

It would probably be possible to write a show report that would make its writer a most popular man among exhibitors. That might be an enviable popularity, for we meet the exhibitors from year to year, and they might become flattered to the point of buying all our meals for us during the poultry show week, and, in general, treating us as a prince.

We have sought popularity with another group, a group whom we have never and can never meet. We refer to the readers of this publication. Our faith and our future is in their hands. We work for them.

In subscribing to American Poultry Journal the reader contributes his mite to pay our way to the shows, that we may see and report to him what was there. Should not a reporter accept the responsibility with a degree of personal liability? Is the reader not entitled to a report that will be pretty much like what a friend would say who had attended the show and returned home? Only will he receive such a report if uppermost in the mind of the reviewer is the army of readers whom he is representing and for whom he should work.

On the other hand, there are the advertisers. What daily paper in the world would send an expert into the stores of its advertisers for the purpose of writing a critical comment on the goods that the advertisers sell? No one would do it. Yet that is what we have to do—we have to comment on the birds of the men who support us. Is it any wonder that at this season of the year we are torn with conflicting emotions

because during the show season our difficulties are increased many fold. Almost anyone can write for a poultry paper ten months in the year, but there are two issues, the January and the February numbers, that try the very sinews of which a man is made.

There are some things that are especially hard to handle. In the Boston show report we write at some length, and out of the usual, about the Reds. Unquestionably the remarks will prove disappointing to some people. For that we are truly sorry.

But we cannot merely drift with the tide. The tide runs out to sea, and it is the part of prudence to point out the danger of a storm that might destroy everything.

We do not want to reflect on the constructive, conscientious breeders of Reds. There are many good men and true who are breeding Reds and who were showing them at Boston. We simply want to break up a game, before it is started, into which loaded dice may be introduced. Let us have square dice of even weight.

We do not say that such a process as is outlined in the Boston show report (this issue) is criminal, but we do say that any such process is unfair as long as all do not have the knowledge that will enable them to do the same thing in the same way. Equality of opportunity to show and win is the important thing.

Let those who make the shows, who in this case are breeding and showing Reds, say what practice is legitimate and what is fraudulent. Let faking be defined and fitting be justified. At the present time there are few rules of discipline, and we are proceeding on the basis that every man knows what is right and what is wrong.

Let us keep the poultry shows a fair and decent place for the good, clean fellows, and a rough place for others.

Living Up to the Opportunity.

Breeders throughout the country are feeling a little self-reproach for the way in which the American Poultry Association has been left to drift. There is a wonderful opportunity for a great purebred poultry breeders' association. The opportunity is in proportion to the need for purebred stock and the need for standards by which to judge and breed that stock.

It is one thing for a big opportunity to stand wide open, and another thing to step into it. We do not always live up to our opportunities, do not always grasp and make full use of them. A man who does becomes a leader.

It was said of William McKinley that he tried to be the sort of man of whom others might say: "If I had had his opportunities, he is the kind of man I should have liked to have been."

There is a big opportunity for the American Poultry Association to render a great service. Thomas F. Rigg sees this and is anxious to serve. That he is the kind of man who can measure up to the opportunity is testified in the following letter from George W. Mitchell, who himself was president of the association from 1888 to 1891, and who was one of the high type of gentlemen who gave that early prestige to the A. P. A. which has endured through the succeeding years. Mr. Mitchell writes:

It is with great satisfaction I note that Mr. Thomas F. Rigg of Iowa Falls, Iowa, has an-

Regal X, First Pen Cock, Boston, 1918

*The Layers Win and the
Winners Lay*

119.75 average per hen for
six Winter months

Maine Laying Record Report

"The pen of White Wyandottes entered by Reuben Lowe of North Shapleigh is the winner of the first Maine Winter Egg-Laying Contest. During the six months ending April 30, 1919, the twenty pullets in Mr. Lowe's pen produced 2,395 eggs, an average of 119.75 per bird. If we estimate that they have produced 50 percent of their yearly output it would give them a yearly production of 239 eggs per bird. This is a remarkable production, and Mr. Lowe is certainly to be congratulated.

UNIVERSITY OF MAINE, COLLEGE OF AGRICULTURE,
LEON S. MERRILL, Director.

Think of it! Each hen consumed \$1.38 worth of feed and laid approximately 10 dozen eggs. Figuring the eggs at an average price, seventy-five cents per dozen from November 1 to April 30, this would leave a profit of \$6.12 per hen.

NOTE—The pen referred to above was of pure Regal Dorcas breeding, proving that heavy egg production is a characteristic of the strain, and has been fixed by generation after generation of careful breeding.

The wondrous beauty of Regal Dorcas White Wyandottes is well known, and their achievements in the showroom are history. However, underneath their attractive appearance are the solid utility qualities that mean profit, and those who own a flock of them have the intense satisfaction of owning fowls that not only delight the eye, but yield a handsome revenue.

As an all-round fowl Regal Dorcas White Wyandottes are as near perfection as anything you will find in the feathered world.

Regal White Wyandottes

ARE THE BEST IN THE WORLD.

If you are not getting good results in fertility and egg production, if your birds are not winning as you would like, why not make a fresh start by getting a foundation pen of Regal Dorcas White Wyandottes? Four thousand Cocks, Hens, Cockerels and Pullets for sale.

Cocks and Cockerels—\$10, \$15, \$20, \$25, \$35 and \$50.

Hens and Pullets—\$7.50, \$10, \$15, \$20 and \$25.

Breeding Pens—\$40, \$50, \$75, \$100 and \$150.

Utility Cockerels—\$5 and \$8 each.

Hens—\$5 each.

Regal White Wyandotte Book

I have just received from the printers another edition of my book on White Wyandottes. It contains 72 pages and is, without a doubt, the most complete book that has even been published, dealing wholly with White Wyandottes. It is full of illustrations from life and its pages deal with a variety of subjects, including chapters on origin, description, feeding, care of breeding stock, fertility, color characteristics, washing and fitting for exhibition, poultry diseases, etc.

EGGS FOR HATCHING

Exhibition matings—\$6 and \$10 per fifteen.

Dorcas matings—\$5 and \$10 per fifteen.

All Star matings—\$20 and \$25 per fifteen.

Send one dime for the Regal White Wyandotte book. The information it contains will be worth dollars to you.

FREE—My 20-page catalog and mating list is free, if you will send me your name.

IMPROVER STRAIN WHITE WYANDOTTES

SOAR HIGH AT THE CHICAGO COLISEUM SHOW DECEMBER, 1920

Repeating my big win of last year by *Winning Three Firsts and Best Display*. The Improvers are successful because they are the Best Bred Strain in America to-day. Remember I have but one strain, the original laying winners. A trapnested exhibition strain of quality layers. For twenty years I have been trapnesting, pedigreering and improving until my strain has no superior. I can supply you birds to win at any show or fill the egg basket.

Cocks or cockerels \$10, \$15 and \$25 each. Pens \$35, \$50 and \$75.

A few cockerels suitable for farm range flocks \$5 each in lots of 3 or more. Catalogue.

L. J. DEMBERGER
IMPROVER STRAIN WHITE WYANDOTTES
STEWARTSVILLE, Box 9, INDIANA

nounced his candidacy for the office of president of the American Poultry Association.

I most certainly desire that not only the nomination may come to him, but that his election might be unanimous, as he is a man so much after the character of the fine thorough-going business men who so many years ago were instrumental in bringing about the organization of the Association.

He would bring to the office not only ability, but great dignity and sterling worth, and would recognize the interests of both the fancier and the utility branches of the work, which is necessary for the greatest success; and being a man with many years of experience, coupled with time at his command, would be able to devote to the work pertaining to the office everything required to bring about a condition of affairs much to be desired.

Here is hoping that Mr. Rigg's nomination and election may surely be brought about.

Inbreeding and Linebreeding.

No two fowls are just alike, any more than any two leaves that fall from an oak tree are precisely alike. The chance of getting one chicken that is an exact duplicate of another chicken, is about equal to one chance in a million.

Every living creature inherits its likeness from its immediate parents and its ancestors. And, if you go back but twenty generations it will be found that a single bird that now lives was represented by 1,048,576 ancestors. A table showing the number of ancestors for twenty generations is as follows:

Generation	Maximum Possible Number of Ancestors	Generation	Maximum Possible Number of Ancestors
1st	2	11th	2,648
2d	4	12th	4,096
3d	8	13th	8,192
4th	16	14th	16,384
5th	32	15th	32,768
6th	64	16th	65,536
7th	128	17th	131,072
8th	256	18th	262,144
9th	512	19th	524,288
10th	1,025	20th	1,048,576

This tabulation shows that if a breeder were to start a strain with a view to breeding for twenty years without inbreeding or going out of his yards for the purchase of a new bird, his original foundation stock would have to number over one million head.

Of course, no flock or strain could have such a multiple origin. Inbreeding in some degree becomes necessary because of overwhelming numbers.

Normally a chick has two parents, four grandparents and eight great grandparents. But, when a sire is mated on his own pullets, both the sire and grand sire of the offspring is the same identical specimen. Mating parent and offspring makes the parent and grandparent the same and reduces the number of birds required for breeding.

Inbreeding, or the breeding together of related specimens, in reducing the number of ancestors, reduces in like proportion the chances for variation.

Variation is a fundamentally important matter in purebred breeding. The value of a breed or variety lies fundamentally in its fixity to a certain type, size and color. A breed must breed pure, that is, must be able to transmit, with a satisfactory degree of regularity, the characters and qualities of the breed.

If inbreeding were not resorted to, characters could not be intensified and fixed. When a sire is bred to his own pullets, which have already inherited the qualities of their sire, the next generation receives a double dose of these qualities. When this process is repeated over and over again, the blood

lines become rich in the desirable points; and specimens so bred are surer to reproduce those points.

Men who pay big prices for birds to improve their own stock, do not want a specimen that simply happened to be a good one; they want a bird that has the rich blood lines that come from close, intensified breeding. Such a bird has the power to stamp his qualities on his offspring and he is therefore a valuable flock improver.

Inbreeding simplifies the pedigree by reducing the number of birds that enter into it. Thus the blood lines are restricted. Outside tendencies and characters are excluded, and only the points which the breeder desires to perfect are perpetuated. Great breeders are always rather close inbreeders.

It is true that the very word "inbreeding" is highly distasteful to many people. Notwithstanding that some of the greatest animals in history have been produced by close breeding, the thought of inbreeding has lost only a part of its terrors with them. When we come right down to actual cases, however, it will be found that the evil effects of inbreeding are usually the effects that result from the breeding of birds that have a predisposition to weakness. When father is mated to daughter, or brother to sister, or son to mother, not only the good points are intensified, but the existing weaknesses are likewise accentuated. When size and vigor are selected, the same as shape and color, no disease or deformity may be attributed to inbreeding as the cause.

There are breeders who have inbred their stock for fifteen to twenty-five years. The foremost producers of high quality Standard specimens have been close breeders, without exception. And, equally without exception have they maintained that no evil results have followed their systems of selection.

These breeders know full well, as is becoming generally understood, that only through inbreeding can a fixity of type be secured and maintained. And as a result of this kind of breeding their stock reaches such a high state of perfection that they know to a nicety what may be expected from a mating before the chicks are grown, and sometimes they dread the introduction of fresh blood, fearing that it will spoil the blood lines that it has taken so long to establish.

These breeders, in commenting on their operations, will tell you that they are "line breeders."

The term, linebreeding, was used originally by the cattle breeders of England to indicate that the progeny descended in a direct line from a famous ancestor. Among poultrymen linebreeding is commonly looked upon as involving the breeding together of specimens of the same family, but less closely related than inbreeding. This interpretation makes linebreeding a mild form of inbreeding. The fact is that linebreeding may involve a very close form of inbreeding, and some cases of inbreeding do not represent linebreeding at all.

Inbreeding is to breed within the line; yet related specimens within the line can be mated to very little purpose, in which case the inbred stock is not linebred. When a specimen is truly a linebred bird, it is the product of a system of breeding that has been carried on to

GIES' ANCONAS

World's Best Layers By Test

Our official government egg-laying contest wins are unapproached by any other strain of Anconas. My customers are winning first prize ribbons at such national shows as Madison Square Garden, New York, Kansas City and hundreds of other shows. They are acknowledged everywhere by many of my customers as the WORLD'S GREATEST LAYING STRAIN in America today—Unequaled in Standard qualities. REMEMBER we are the originators of this great laying and winning strain. Place your order at HEADQUARTERS and make no mistake.

POULTRYMAN, IT'S FREE

Our catalog and price list, containing full information and testimonials verifying our claims. Last year's customers had great success with chicks and egg shipments. We prepaid express charges.

OSCAR G. GIES, Box 74, BRIDGEPORT, ONT., CAN.

Tarbox's Silver Wyandottes and Speckled Sussex

Our Silvers again win the most coveted prize—Best Display at the Club Show, Milwaukee, Wis., Nov. 24-26, 1920. On Speckled Sussex we won five 1st and two 2d on seven entries; Red Sussex four 1st on four entries. At the Chicago, Coliseum Show, Dec. 1-6, 1920, we won on Silvers, six 1st and four 2d on 10 entries; on Speckled Sussex, 4th cockerel, 5th pullet and 3d young pen. A few Red Sussex to close them out at bargain prices. Get our prices on Silvers and Specks before placing your orders.

stamp on the offspring certain desirable qualities and characteristics of the ancestors.

When the application of inbreeding is in the hands of a thinker who is ever drawing his blood lines from the past and projecting them into the future; when inbreeding is to concentrate the blood of certain individuals for definite purposes of improvement, then is inbreeding properly termed linebreeding.

We believe, as a bit of general advice, that it is well to say that linebreeding should not be undertaken in a purely theoretical way, according to some chart. In many small flocks there is not a single bird that should be linebred. Improvement in such flocks would come much faster through the purchase and introduction of a fine, thoroughly bred specimen.

Occasionally there is born into a flock a specimen of outstanding quality and unusual vigor. Fortunate is the breeder who develops a bird of this kind. Such a specimen is splendid foundation material that should not only be bred but be bred back to.

W. H. Card, who originated the White Laced Red Cornish, has an old cock that is now five years old. He has bred him back to his daughters, granddaughters, great granddaughters, and great great granddaughters. His first prize cock at the recent Boston Show was another remarkable bird, four years old, and he had been bred back in the same way for three generations. The birds are coming better all the time. They are broader bodied and heavier shanked than formerly. Their color is so far superior to what prevailed a few seasons back, that it would almost seem that some other blood had been introduced.

A prepotent sire of this kind that transmits and stamps himself on his offspring is a bird that should have no price label tied to his wing.

His own sons are infinitely more valuable as sure breeders than were the cockerels sired by males twenty years ago, in the early days of this variety, when there was no inbreeding back of them. Inbreeding has reduced the chances for variation, and since there is less chance for a turning out of line, the quality of the breed becomes established with mathematical certainty.

It should be stated, however, that the beginner should develop an eye for type and color and should not solely depend on a mere mechanical method of linebreeding. It would be better to forget all about pedigrees and relationships, and mate the birds as they stand in the yards for results, than to enter into a pedigree craze. That is why we do not recommend chart breeding; it puts too much importance on carrying out a pedigree in a rigid line, and does not lay enough emphasis on the individual bird.

The individual specimen is the big thing, and equally vital is an eye to appreciate it. We would rather have an individual that had some close, intensive breeding behind him, because we could then be sure of his breeding power; and one thing certain we would inbreed him to his own get. Even if his pullets were not attractive, they would carry his blood, and when mated back to him, would throw some elegant cockerels.

A single instance will serve to illustrate the value of a good bird. For years an important section of the Buff Wyandotte fancy centered around north-

They have never failed to produce results!

Our strain has made amazing records in egg laying contests of national fame and record winnings in America's largest show rooms.

Our customers share equal honors with us because we have no reserve matings or birds. The winnings of our customers at Kansas City, Omaha and other large shows is convincing proof of this.

HILLVIEW SINGLE COMB WHITE LEGHORNS

The impressive winnings of Hillview Leghorns of almost every ribbon at the Chicago Coliseum shows of 1918, 1919 and 1920 and the winning of first prize pen in Missouri and American egg laying contests is still an unbroken record.

At the last Missouri laying contest five birds hatched June 26th layed 1096 eggs for the year. The best record over all Leghorn pens from January 1st to October 31st.

Hatching Eggs and Baby Chicks

from Hillview will give you the most pleasing results because you get exactly what you order. Book your orders now to insure prompt delivery.

HATCHED by the thousands--dying like flies--that was the history of artificially brooded chicks until the Buckeye Colony Brooder was invented.

Actual experience took the "pep" out of chicken-raisers. Correct brooding seemed impossible. But the Buckeye Incubator Company kept at it until the greatest of all brooders was evolved. Now three chicks live where one lived before, and the labor is cut to a fourth. The Buckeye Colony Brooder solved the problem of making chick raising profitable.

Talk to the man who went through the experience. Let him tell you what revolutionized the chick industry. Yes--ask the Buckeye user--he knows!

BUCKEYE COLONY BROODERS

*Buckeye Standard
Incubators*

*Buckeye Mammoth
Incubators*

*Buckeye
Coal-Burning
Brooders*

*Buckeye Blue-Flame
Kerosene Brooders*

*Buckeye Lamp-heated
Brooders*

What the Buckeye Colony Brooder has made possible, where hard coal can be obtained, the Buckeye Blue Flame Colony Oil Burning Brooder is making possible for others.

More than that, the perfected Buckeye Oil Burning Brooder has come into its own, thus furnishing a perfect brooder for every condition, giving the Buckeye unquestioned leadership in brooders as it has in incubators.

Buckeye Brooders, in combination with Buckeye Incubators, have solved the chick raiser's problems. Their use takes the gamble out of the chicken business and unerringly points out the way to success.

THE BUCKEYE

OVER THIRTY YEARS OF
SERVICE TO POULTRY RAISERS

411 EUCLID AVENUE

in Chick Raising

THEY grow three chicks in the same space where one grew before, and actually cut the expense right in half. Before their general use it was the usual thing for the raiser to lose from a quarter to half of all the chicks hatched. Today the same men, using Buckeye equipment, bring to quick maturity from eighty-five to ninety-five per cent of all the chicks hatched out, and do it with a quarter of the labor, half the expense and none of the worry.

These facts are proven by the experience of the hundreds of thousands who successfully use Buckeye equipment, as well as by the fact that Buckeye sales equal those of our largest three competitors.

Ask the Buckeye user -- he knows! Buckeye Incubators and Brooders are endorsed and recommended by all agricultural colleges and experiment stations in the United States and Canada. Over 600,000 are giving satisfaction to poultry raisers, and over 15,000 dealers sell poultry raising equipment.

Start for success by seeing the Buckeye dealer. If you don't know him, write to us for descriptive catalog.

eastern New York state. About 1900 a number of the best breeders participated with an entry at the Cambridge (New York) fair to determine which of them had the best stock. R. Brooks Robbins showed a sensational male bird which has been described to us by John D. Jaquins as "possessing an even shade of color, a little chestnut on tail, and nearly clear wings—about a shade darker than is being shown now." At that time this bird was the only short-backed, typical round-typed male of the variety that had been shown. He was entered as a cockerel, but before the ribbons were placed Mr. Jaquins bought the bird and re-entered him as a cock, the fair being held in August and the bird having been hatched very late the previous season.

Mr. Jaquins bought the male for fifteen dollars. Frank Bean offered twenty-five dollars for him. Every breeder who saw the bird appreciated him, and Mr. Jaquins had a number of chances to sell him, "inquiries even coming from Canada for this wonderful male that had been written up in papers." The bird at last was purchased by the late Warren T. Lord at something like fifty dollars and became the foundation of Mr. Lord's fine male line. Indeed, from this sire was developed the best line of Buff Wyandotte males in the country.

How was it developed? Only in one way. By holding ever in mind the Standard ideal, by critically selecting the males to that ideal and mating them to females of their own blood. That is inbreeding, and linebreeding and selective breeding.

Good and Bad Mother Hens.

After comparing the chicks, one lot from a good mother hen, the other from a bad mother, I feel free in saying the bad mother is just about as bad as the makeshift brooder and the inefficient incubator attendant. Last September I set two Barred Plymouth Rock hens the same week. I cared for them alike. The two hens were as different in nature as if they were of an entirely different breed. The good mother was on to her job. She came off, got what I gave her to eat, and was soon back to her nest. She hatched every hatchable egg and raised every chick to be two-pound broilers at two months old.

The other hen, after eating all I gave her insisted on following me around. I was simply forced to catch her and put her on the nest to keep the eggs from getting too cold. And the last few days I had to fasten her in the nest. I knew her eggs were not incubated right, but I let her hatch, and she surprised me, too, as she hatched nearly every egg. In one week she had lost two chicks. The third week they were all gone but two, and I gave them away for pets, so I could fatten the hen for market or keep her for laying only. The two chickens at two months old would not weigh a pound.

I have had similar experiences in the spring season, and find I lose more chicks from this cause than any other. I pick my good mother biddies the same as the good layers, and I have found it pays as well.

CURRENT NOTES AND COMMENT

Sold Ten Birds at \$30 Each.

A poultry judge who was on a train in Central Illinois recently was recognized by a fellow passenger, who said: "Pardon me, but aren't you Tom Rigg?"

"Yes, sir, I am."

"Well, I am A. C. LeDuc, and fifteen years ago you judged my Silver Wyandottes at the Chicago show."

"Are you still breeding Silvers?" the judge inquired.

"No, I don't own a feather. I am sorry to say so, but after winning at Chicago the last time a breeder from Canada visited my yards and offered me \$300 for two pens of five birds each—\$150 a pen. It looked like a big price to me, and after debating the matter in my mind for a time, I accepted the offer.

"The birds went to Boston and won. It was a good buy for the customer, but it put me out of business. It took the cream of my flock, and I wasn't able to breed another good one with what I had left. It was a poor sale for me—the worst I ever made."

And so the heading to this item, "Sold Ten Birds at \$30 Each," may look alluring—but the price in this particular case was not high enough.

* * *

Wyandotte Breed Book Nearly Ready

Harold A. Nourse, editor of the Wyandotte Standard and Breed Book, which is to be published by the American Poultry Association, wrote us under the date of January 10:

As a principal author of the Wyandotte Standard and Breed Book, I know you will be interested to learn that it now seems probable that the book will be ready for distribution in comparatively few days. The printer has complete instructions for everything, and most forms are off the press. One form was held up by damage to plates, and new half-tones had to be made. I have O. K'd every form but the last one in the book, and expect a proof of that every day. Complete final instructions have been given on every point. I sincerely hope you will like the book, and I feel sure you will.

It was well in November before the finance committee completed its new contract with the printer, and almost December 1 before I was able to get the first lot of page proofs. On December 7, however, I had mailed to the printer the O. K'd page proofs for the entire book except the index, which of course could not be made up until the pages were complete. The delay caused by the damage to plates, etc., has held the book up, but now it looks like plain sailing to finish it up quickly.

* * *

Prices for Hatching Eggs.

If alongside of this issue of the Journal could be laid a copy of the February, 1913 issue, it would be found that eight years ago more birds were being offered at \$5 and \$10 each than at present, but prices for hatching eggs were as high or higher than now.

For the season of 1913, which was before the world war started, good breeders were advertising eggs from their carefully mated breeding yards at \$10, \$15, \$20 and \$30 per sitting, while one prominent breeder was asking \$3 each for eggs.

(Continued on page 172)

MAHOOD'S S. C. R. I. REDS THEY POINT THE WAY

Twenty birds under blue ribbons, including best display at the Chicago Coliseum Show

THE WORLD'S GREATEST RED SHOW, is a part of the unparalleled record of Mahood's S. C. Reds during the nine successive seasons they have been successfully exhibited at this show.

Letters received from customers almost daily at this season of the year tell of remarkable layers and fine breeding and exhibition birds raised from chicks or eggs from Mahood's Reds.

Mahood's pens will continue to produce the same outstanding quality in breeding and exhibition birds for Mahood and Mahood's customers, for not only is every bird in these pens rich in the blood of nine generations of Chicago Coliseum winners, but these remarkable bred-in-quality Rhode Island Reds are carefully and scientifically mated with the skill that only years of experience in breeding exhibition Rhode Island Reds can give.

Hatching Eggs

Send for Mahood's beautifully illustrated free mating list and read the liberal egg offer and fertility guarantee.

Eggs from Mahood's S. C. Red mated pens, \$20, \$15, \$10, \$6.50 per 15; eggs from Hogan Tested matings, \$6.50 per 15. Utility eggs, \$20 per 100.

Baby Chicks

Chicks from mated pens, \$3.25, \$2.50, \$1.60 and \$1 each. Mahood still has a few splendid quality cockerels and pullets to spare at \$7.50, \$10, \$15, \$25 and \$35 each.

Also a few carefully mated pairs, trios and pens.

Old Trusty

Have Made Millions for

Write Quick for 1921 Book and Price

This is the year of all years to raise poultry for profits, and Old Trusty is the incubator you need to shell out strong, healthy chicks—hatch after hatch.

Old Trusty owners have made millions with their machines and will make millions of dollars more this year.

Mail the
Coupon
or a Postal
Today and
get this
Book Free.

The number of Old Trusty owners grows so fast that it is hard to keep track of them. There are now about 900,000, and we are going strong to make it a full million this year. We are making a quick shipment proposition that will interest you. Write today and let me tell you about it.

Make Profits Like These

Thos. Ashley of Kimball, S. D., with one Old Trusty sold \$350 worth of eggs, \$200 worth of pullets, \$200 worth of roosters and had 50 hens left. There's \$750 profit, to say nothing of what the family used and the 50 laying hens still on hand. H. F. McDonald of Manchester, Iowa, says: "My poultry profits for 10 months are \$1,084." Miss Dora Young of Holden, Mo., says: "We sold \$3,000 worth of eggs on the local market of our town during the last three years." A bank clerk in Beatrice, Neb., found that, after paying all expenses, he made \$1,300 net profit. Another customer in Pennsylvania made enough from Old Trusty to build a fine home. I could go on naming thousands and hundreds of thousands of Johnson customers who are swelling the family income from \$800 to \$1,200 every year. But their money doesn't buy anything for you. Why not get your name in this list and make several hundred dollars this year from a small investment? Let me help you with my big free book.

The "How" of Poultry Profits

Suppose you started early this year with an Old Trusty incubator and a brooder or two. You make several good hatches and come out with \$600 or \$800 in a few months with a good-sized flock to supply high-priced eggs for the market. Do you know of any other means of making several times your original investment with so little work?

Nearly a million Old Trusty customers scattered all over the country have been taking advantage of the great profits to be made from poultry. Many thousands more will start this year because

This Is the Year of All Years to Raise Poultry. Old Trusty Will Make \$300—\$500—\$800—\$1,000 for You Easily

Harry Johnson
"The
Incubator
Man"

M. M. JOHNSON
Inventor of Old Trusty

Incubators

Owners Everywhere

Ideas That Make Money

You will find hundreds of them in this book. It's the best book I could write after 28 years' experience and I am sure you will find it helpful. It is a real "How" and "Why" book of poultry profits filled with subjects like these:

- How to keep hens a-laying in winter.
- How to pick the money-makers in a flock of pullets.
- How to make poultry raising a business.
- How to choose the best breeds.
- Why early hatches are the most profitable.
- How to preserve eggs.
- How to choose the right size incubator.

Remember, poultry develops quickly. It means quick profits. Six months from hatching time the pullets will be laying. Roosters can go on the market within three months and more than pay the cost of incubator, eggs and oil.

Multiply these hatches three to five times a season and see the profits pile up. This is your year of opportunity to make money with poultry. The margin between producing cost and selling price has widened until it is almost too good to believe today.

Mail the Coupon or a Postal Today

Let me tell you more about your opportunity this year in my new 1921 book. I'd like to mail you a copy and have you pass judgment on it. You'll agree with me that it's a real "How" book. Remember, it's free. The coupon was put in here for your con-

venience, but if you want to, write me a letter or just drop me a postal. But send right now so the mail man can leave you this book in a day or two. Ask for Book No. X-25. Yours truly,
Harry Johnson, "Incubator Man."

M. M. JOHNSON COMPANY, Clay Center, Nebraska

How Many Poultrymen Know What's in an Egg?

Here is a chemical analysis:

	Percent
Protein	13.5
Fats	17
Sulphur	2
Water	67.5

The combined Protein, Fats and Sulphur represent 32.5 percent of the egg; Water, 67.5 percent—107.7 percent more water than the combined other elements.

How then can a bird produce eggs if she does not have a continuous water supply? Let us answer it for you—she just simply can't and doesn't! A bird will not drink *ice water* any quicker than you would if you were working outside in cold weather. She requires it with the chill removed in order to consume sufficient quantities to supply 67.5 percent water for eggs and the necessary amount for blood.

Water is actually worth over 200 percent more to your birds than feed in egg production and is therefore actually worth in dollars and cents just \$2.08 to every \$1.00 you put into feed.

Now Mr. Egg Producer, get busy and keep water before your birds *all the time* at such temperature that they can and will drink it—not hot or warm water, that weakens them, but just right—not cold or not hot, but just with the chill off.

There are two ways of doing this—stay right with them all day long running back and forth with water or INSTALL NORWICH AUTOMATIC AIR LOCK FOUNTAINS, fill when empty and the machine does the rest. The fountain can't freeze; it has been operated in Alaska at 60 degrees below zero; and your birds are assured a continuous supply of fresh, clean water at exactly the right temperature and if they are watered but once a day at the present time **WE WILL GUARANTEE A 50 PERCENT INCREASE IN EGG PRODUCTION** by the use of the Norwich Automatic Air-Lock Fountains.

Pretty strong talk but **PROVEN ACTUAL FACTS**.

By comparing these figures with current quotations in this issue it will be seen that war-time prices were never reflected in the hatching egg trade. On the other hand the quality of the breeding flocks has materially improved during the last eight years, and the buyer today gets eggs from birds of better quality and from birds that, having been bred longer in line, are more certain to reproduce fine quality.

It is futile to search for bargains in hatching eggs. Any sitting that will bring \$20 is produced by birds of such quality that their chicks, if raised on the home plant, would be worth several times that amount of money.

The breeder in selling choice hatching eggs is letting his customers participate in the opportunity to raise some of the best birds of the year, and in the fall stand shoulder to shoulder with old-timers, who have put many years of hard work into their breeding operations.

* * *

A Letter of Appreciation.

In the preparation of "The American Breeds of Poultry," we undertook to tell the fundamental things that would equip the breeders of these fowls with a knowledge that would prove truly helpful. We believed that the effort would be appreciated, and the following letter says those things which we hoped might be said:

Your book entitled "The American Breeds of Poultry," was received yesterday, and after devoting last evening to a perusal of its contents I want to congratulate you as author of this splendid piece of literature. In my judgment it is a distinctly high class piece of work and will be a material contribution to the highest type of live stock literature.

I was more than pleased with the two chapters, "The Breeder" and "Breed Type." The former chapter cannot help burning its way into the coldest heart as the sentiments expressed ring true, not only when applied to poultry breeders, but to the supporters of every class of live stock.

Whatever may have been your purpose in the preparation of this volume, I am sure it will supply not only the much needed information to the general producers of poultry, but it makes the breeders' responsibility so clear that it cannot be easily side-stepped or forgotten. I am sure that the standing of the American breeds will be lifted higher in the minds of the live stock folk by the influence of this book. To my mind, it would be difficult to conceive of more worthy compensation for your efforts.

W. H. SMITH,
Associate Professor of Animal Husbandry,

* * *

An Australian Egg Competition.

In the recent ninth Victorian Egg Laying Competition, Australia, some pens of layers were fed wet mash through the year, and other pens were fed dry mash. There was not much difference in the egg yield.

The wet mash birds laid a larger number of eggs outside the trapnests. The high dry mash pen laid 1,573 eggs in the year, only two of which were laid outside the nests. One pen of wet mash birds laid 272 eggs outside the nests.

On the whole, a little over 3 percent of all eggs were laid outside the nests, which compares with 4 percent laid outside the trapnests at the Maine Experiment Station.

There is a tendency among caretakers to credit floor eggs to the high hen in each pen. She is naturally the favorite. It is probable that absolute accuracy is only possible when a single bird is put in each pen. Single

AREY'S BARRED PLYMOUTH ROCKS

Won at Boston, Jan. 1919, nineteen regular and special prizes including three firsts. Jan. 1920, eighteen regular and special prizes including three firsts also.

Also in both years the coveted honor of BEST DISPLAY. Few breeders have ever won this distinction in two successive years.

Fine line of fancy breeding birds for sale. My birds are constantly making history in points of utility.

One hundred beautiful BRED-TO-LAY cockerels at \$10 while they last. Utility pullets \$5 each in small lots. \$4 each in lots of 25. Utility hatching eggs \$10 per 100.

Am prepared to furnish big incubators. Book ahead if in earnest. Eggs from fancy matings \$10 per 15. New mating list out about Feb. 15. Get my catalog now—it's ready—it's free.

M. S. AREY

BAR HARBOR, MAINE.

Feed the Whole Chick

They can build only as you furnish the material

No wonder so many grain fed chicks are scrawny, badly feathered, light boned and sickly. They don't get enough of the necessary materials to build their bodies.

As the chart above shows, grain feeds furnish too much food for energy and heat, and less than half enough for blood, bones, nerves, vital organs, muscles and feathers. How could chicks build strong bodies when they are so short of materials needed for almost every part of the body?

Purina Chows supply all growing needs

The protein and mineral elements that are deficient in grain rations are abundantly supplied in Purina Chicken Chowder and Purina Baby Chick Chow. These are just the elements needed to develop big, strong bones, and plump muscles—to grow red-blooded, bright-eyed, active chicks that feather early and make early broilers. Read the Purina Guarantee of double development during the first six weeks. Send for the Free 100 page Purina Book. Say whether or not your dealer sells Purina Chows.

RALSTON PURINA COMPANY
801 Gratiot St. St. Louis, Mo.

Ft. Worth, Texas Nashville, Tenn. Buffalo, N. Y.

Purina "Double Development" Guarantee

The money paid for both Chows will be refunded if baby chicks, when fed Purina Chicken Chowder and Purina Baby Chick Chow, as directed, do not develop twice as fast during the first six weeks as when fed a grain ration only.

"Purina Book" Free

100 pages—Profusely Illustrated

You will be especially interested in the chapter on how to detect the slacker hen without trap nests, and in another containing plans for houses and home-built equipment. There are also chapters on feeding, hatching, brooding, care of chickens, cure of diseases, moulting, care of layers, and other topics. There are monthly reminders and blanks for egg records. Send for your copy at once. Mailed postpaid, free to any address.

Sold in Checkerboard Bags Only

**"THE ONE
PERFECT
BROODING
DEVICE"**

You Will Need The Sanitary Hover

**For the Proper Care of
Your Chicks**

The success or failure of a poultry plant depends not upon the number hatched but upon the number and kind you raise.

Newly hatched chicks do not represent profits, but possibilities. No one can lose sight of this fact, no matter for what purpose you are raising chicks.

A successful brooding system means to the fancier more

good stock from which to select his own breeders and exhibition fowls.

To the market poultryman whose profits depend on the number quickly matured, a faulty brooding system means failure.

There is but one brooder that combines rigid economy with absolute effectiveness—"The Sanitary Hover".

It is "The One Perfect Brooding Device." In it are found Nature's principles applied to the artificial brooding system.

It is the hen's only rival. Its features are so many that it takes a book to tell the story.

Now is the time for you to figure on your equipment for this spring. And you know how much depends on this. Do not fail to write for the book—"Solving the Brooding Problem." It is mailed free.

The Sanitary Hover is guaranteed to raise better chicks and a higher percentage of the chicks entrusted to its care than any other brooding device.

International Sanitary Hover Co.
413 A Washington Avenue St. Louis, Mo.

ANDREWS CARRIERS

For Baby Chicks

Three sizes, for 25, 50 and 100 chicks. Built to conform to International Baby Chick Association specifications. Car lot orders made to meet buyer's specifications. Strongly built of heavy corrugated board—waterproof inside and out—shipped flat—set up in a jiffy. And they carry the chicks in comfort and safety.

Andrews Carriers are made in one of the world's greatest box factories. We can promptly make shipments of any quantity—from two dozen of a size up to a carload. And our prices are surprisingly low. Andrews Carriers are right. "Ask the Judges." Write now for complete catalog.

O. B. Andrews Co., Dept. A, Chattanooga, Tenn.

For Eggs

Ten sizes—ranging from 12 to 120 egg capacity. These carriers absolutely prevent breakage. Further, they protect the egg-contents by preventing shocks. Each egg protected by several thicknesses of corrugated cushions. Simple and practical. Can be used many times, but cheap enough to throw away after a single trip.

What's a CAPON and Why?

A book that explains everything you will ever want to know about CAPONS. 50 pictures from life that show each step in the operation. List of Capon Dealers' addresses. Tells how to prevent "Slips" where to get the best and cheapest capon tools. Capons are immense eating. Big profits realized. Get wise. This book tells how. Copyrighted new and revised edition. Regular 50c copy, prepaid to your address (a short time only) for a Dime in coin or stamps. **GEORGE BEUOY, R. R. No. 7, CEDAR VALE, KANS.**

"DANDY" BONE CUTTER

You needn't pay one penny for this bone cutter until you try it and it satisfies you. Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy Green Bone Cutter cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood, feathers. Our terms on the Dandy Bone Cutter are:

No Money In Advance—15 Days Free Trial

The Dandy costs less than most bone cutters and it works infinitely better. Also cuts meat, vegetables, roots, etc. To ensure big sales this year we have made special reduction in prices. Write quickly for free booklet. Prices are liable to rise next month, owing to big demand for raw material. **STRATTON MFG. CO., Dept. G, ERIE, PA.**

pen testing is now being carried on to some extent in Australia. Out of 750 birds in the ninth Victorian contest, 150 were single tested.

During this contest 30 birds died out of 750 in the competition, or 4 percent. This is not unreasonable, and such a loss is to be expected in any large population of hens or animals.

Nearly half the total number of pens failed to produce eggs that would average 24 ounces to the dozen. This is an alarming deficiency in the size of the eggs. Are utility breeders laying too much stress on mere number of eggs?

Reports also indicate that too many of the birds were underweight for this breed. Small specimens are frequently the best layers. However, size of bird and size of egg "run out," if these point are neglected and preference in breeding given to hens that list up well in mere number of eggs laid.

Dr. Rintoul, who had charge of the Victorian contest, impresses upon breeders that, "for breeding purposes, figures alone must not be relied upon. The first essential is a sound and vigorous constitution, and is of far greater importance in establishing a flock than a mere matter of some eighteen or twenty eggs. I have personally seen at laying competitions birds which laid upwards of 300 eggs in a year, but, except for color, they had no claim to the breed under which they were entered, and others that were too weak constitutionally to be considered suitable breeders."

* * *

Tariff on Wheat.

Poultry feeders need not be alarmed at the prospects of a tariff on wheat that will increase wheat prices. If wheat prices could be increased, other grains would follow.

Wheat is not a United States commodity. It is a world commodity. A high tariff will prevent Canadian wheat from coming into our markets, but it will force Canadian wheat into British and European markets in greater quantity.

On December 16, Europe was reported to have taken 3,000,000 bushels of U. S. wheat and 750,000 bushels of Canadian wheat.

If a tariff is raised to prevent Canadian wheat from coming into the United States, flooding our markets and depressing wheat prices, the same Canadian wheat will go for export and we will be flooded with our own wheat.

Wheat is not a crossroad's commodity around which a tariff wall can be built for protection. World conditions determine wheat prices.

* * *

A Boost for Rose Comb Reds.

According to W. H. Card, secretary of the Rhode Island Red Club of America, Rose Comb Rhode Island Reds in the South do not have "sore-head." The reason, according to Mr. Card, is that Rose Comb Reds are not bred in the South. Commenting on the situation in the American Fancier, Mr. Card says:

The army of novices controls the situation as to the popularity of any breed. It matters not if the Rose Comb Reds are every bit as good and as profitable as the Single Combs.

How many times the question comes to this

office: "Why are the Single Comb Reds more popular than the Rose Comb? Are they better?"

The Rose Comb R. I. Red has every quality and attribute of the single comb, or to put it more properly, the Single Comb Reds got their good qualities from the Rose Comb variety.

Tuttle, Pickett, Bean, Harold and Lester Tompkins linebred the Rose Combs years before much attention was paid to the Single Combs. It is only within the last dozen years that the Single Comb variety has been considered of show merit, whereas, the Rose Combs have long been noted for their uniform color and type and prepotency of blood, this being a tremendous factor in any breed.

We are glad to see a good word said for Rose Comb Rhode Island Reds. But a few years ago, as well known a breeder as Harold Tompkins was doing more business in his Rose than in his Single Combs. A great many people, however, seem to feel that a single comb becomes a chicken better than a rose comb. But is it not like horned and polled cattle—largely a question of taste?

* * *

Black Spanish.

During the Chicago show, Clarence Hewes suggested to several members of the Standard committee that the Standard for Black Spanish should not lay special emphasis on the length and size of the face. Mr. Hewes stated that he had found the while faced breed extremely useful, a good grower, a good layer, a vigorous fowl—as long as the face was not bred to abnormal proportions.

On this subject, an old Spanish breeder writing in *The Feathered World*, London, says:

As is well known the Black Spanish has now practically "run to face," to the great detriment of its laying powers, and as regards the chicks and young birds, its hardihood. I am endeavoring, as far as I can with the limited material at my disposal, to get back in some measure the first of these qualities, for which the breed was at one time so justly celebrated.

As an example of what can be done by selective breeding, the Spanish is a wonderful example. It should be remembered, however, that such breeding is artificial selection, and natural selection, or the survival of the fittest, is not allowed to operate.

Long, continued selective breeding to a Standard of abnormality results in the survival of many birds that are unfit from the fundamental standpoint of vitality, and at length the variety breaks down.

By breeding a normal face that is white, instead of a long, pendulant white skin that hangs from the face, the intrinsic merit of the grand old breed can be regained. We are glad that normalcy is entering into the minds of some of the breeders of the extremist types.

* * *

Leghorn Tail Carriage.

A breeder from Fond du Lac, Wisconsin, writes that he has been breeding S. C. White Leghorns for several years and wants to show at the local show. He says:

I am a back-lotter, so to speak, and have been breeding mostly for eggs, never giving the show room the least thought, as I always maintained there was a lot of extra trouble connected with the showing of birds.

I have studied the article in your December number, written by Charles Hubbard, and I intend to follow this article in regard to conditioning as near as possible.

Now the question I wish to ask is this: In regards to spread of tail does one have to

teach the bird the way to hold its tail spread out, or does that come by proper conditioning? My birds pose now any way I have taught them, but it seems I have no success with them spreading their tails, such as I see in the Journal of other show birds. Which is the best system of training them to hold their tails properly, providing it does not come by proper conditioning?

Carriage of the tail is largely a matter of breeding. A cockerel can be well bred, and run in a bunch of males, and be scared so that he carries his saddle feathers tight to his body and his tail high.

A bird to carry his tail right must be well bred and then grown and housed so that he feels a certain measure of ease and contentment.

It is probably because the correspondent's birds have not been bred for style and carriage that they do not spread their tails like the birds he sees pictured. If he should secure eggs for hatching from such breeders as win in the S. C. White Leghorn classes at such shows as Chicago and New York, he would find that his best specimens carried their tails correctly from the time they first grew a tail, even though that first tail was composed only of chick feathers.

Quisenberry to Manage Kansas City Show.

T. E. Quisenberry has been elected secretary of the Heart of America Poultry Show, and the next exhibition will be caged at Kansas City, Nov. 29 to Dec. 4, 1921. Chas. Grunske, formerly secretary, has been elected vice president, and Reese V. Hicks is elected president.

Mr. Quisenberry is an experienced show manager, having staged two of the largest shows ever held in St. Louis, and two of the largest and most successful shows ever held in Kansas City. He was selected by the chief of the Live Stock Division of the Panama-Pacific Exposition to conduct the great World's Fair poultry exhibition at San Francisco, and was successful in bringing out an entry of about 9,000 head from 38 states.

The Kansas City show should be one of the big shows of the country. It has the territory to draw from. However, the west has not been made to feel that Kansas City is the representative show at which western breeders should entry. The western boys don't merely want to see models from the east; they want a competition in which they can get a few prize ribbons.

Kansas City should get a world of entries from Oklahoma, Texas, Arkansas and the rest of that great big territory to the south, west and north. We believe that Mr. Quisenberry will cater to the breeders in that vast part of the country and give them a show that they will support by entering their chickens.

Poultry Association

The World Is Still Crying for More POULTRY More EGGS!

You are not taking an experiment when you get a "Successful" Incubator. It's backed with 28 big successful years of experience. It's exactly the machine you want this year to help reduce the great meat shortage.

Answer the Call Via the "SUCCESSFUL" Route

Enjoys a 60% Egg Yield

Big Run, Pa., Jan. 20, 1920.

Gentlemen:—Have had splendid success with your Sprouter, Incubator and Brooder secured last season. Very few people secure eggs this winter, but I have been getting about 60% from my flock. I know this is due to feeding correctly sprouted oats. I think the sprouter is just wonderful.

Box A25. MRS. JNO. L. KELLY.

20 Big Points

- 1—I personally guarantee that the "Successful" Incubators will hatch larger and stronger chicks and a larger percentage than any other incubator when operated under the same conditions.
- 2—My remarkably low price offers with high quality.
- 3—The only hatcher that heats the colder edges of the body first.
- 4—Round corners on tank, giving faster current, more heat, even regulation.
- 5—Heaviest copper tank used on any incubator.
- 6—Only one scientifically ventilated. Admits cold air at center of top. Does not create draft which dries out eggs.
- 7—Safety attachment on lamp burner—provides absolute protection from fire.
- 8—Only incubator with two glass doors—through which thermometer may be seen.
- 9—Combination wafer thermostat regulator.
- 10—The only machine guaranteed with a guaranty that guarantees and evades no issue.
- 11—Built like a refrigerator.
- 12—Case non-warpable.
- 13—Weights more.
- 14—Costs less per pound.
- 15—Strongest, most durable egg trays.
- 16—Nursery under egg trays. The greatest feature applied to artificial incubation.
- 17—Detachable legs, allowing machine to be stored in very small space.
- 18—The only incubator in the world cabinet made.
- 19—Simple, effective application of moisture when necessary.
- 20—Adjustable thermometer. Never necessary to open doors or pull out the trays to read temperature. Thermometer is stationary; chicks cannot knock it over.

START your year with a good incubator. Be sure of your profits. That's my argument to you this year, reader, and I am backing it up with a machine that has stood the test of 28 years and has helped to make many of the *biggest money makers* in the poultry business. I offer with it no premiums, no sensational claims, no fancy frills, nothing but a pure quality hatcher at the lowest price possible.

Write for Catalog—Mail the Coupon

and let me prove my offer with a money-back guarantee. Take two or three hatches at my risk. I'll let you be the judge. Write today.

"SUCCESSFUL" Incubators and Brooders

Read the 20 points of construction. Here is the only incubator in the world that's *really* cabinet made so far as I know. The only hatcher that heats around the colder edges of the body first. Guaranteed to vary not over a fraction of one degree throughout the entire hatch—because our patented lamp and wafer thermostat regulators are 99.9-10 per cent perfect. Center top ventilation prevents dead chicks in the shell. But write for catalog and read all about it.

Poultry Lessons FREE

20 lessons in all, the real, genuine down-to-brass-tacks facts that explain the way to make money with poultry—everything just as you want it. Free to everyone buying a "Successful" Incubator or Brooder.

Famous little booklet, "Proper Care and Feeding of Chicks, Ducks and Turkeys," sent for 10c. Big poultry catalog is FREE. Write for it today. We also have high-grade poultry—stocks and eggs of all the leading varieties—land and water fowls.

**28
Years' Experience**

"That's What
Makes Me
Lay"

Pure
BUTTERMILK
Dried
"The Great Egg Maker"

**-Twice as many eggs
-Better health conditions
-Lower feed cost
-Bigger profit**

These are the results that follow feeding your fowls P.D.B. (Pure Dried Buttermilk) just as sure as night follows day. It can't be otherwise because P. D. B. supplies your fowls with Lactic Acid—Vitamines—Proteins—Carbohydrates, etc., in just the proper amount to promote best health conditions and maximum egg production.

**Nothing Else Like It
Nothing Else Equal to It**

Universally recognized as the world's greatest poultry food—buttermilk is now available to every poultry raiser in powdered form—made from pure creamery buttermilk right from the churn. Put up in 10, 25, 50 and 100 lb. paper lined non-wasting bags, you can add it to your grain ration or any mash feed and double your egg yield. It is a natural egg producer. A poultryman in Pennsylvania writes that in 21 years experience of feeding for egg production he has never found anything that produces eggs as cheaply and keeps fowls in as healthy condition as Pure Dried Buttermilk.

Write for Free Sample

If you would like to see what P. D. B. is like, ask for free sample. Better still, pin a one dollar bill to your letter and we will send you by parcel post, charges paid, a 5 lb. sample bag, enough for 25 laying hens for 30 days. The season of high egg prices is here. Eggs are always in demand and generally command very high prices. Get the eggs now. If not satisfied with P. D. B. your money will be refunded.

OZARK POULTRY FARM

Ferris 230-300 egg strain S. C. White Leghorns. With five birds shown at the Monett Poultry Show, January, 1920, we won 1st cockerel, 1st pullet; at the same show, December, 1920, with five birds entered, we won 2d cockerel, 1st, 3d, 5th pullet. We have a fine lot of cockerels at \$5, \$7.50 and \$10 each. All foundation stock purchased direct from Ferris. Range raised. Eggs, February 1, \$15 per 100; chicks, March 1, 30c each in small lots; eggs and chicks prepaid. Everything shipped direct, subject to your approval. Twenty percent discount on five or more cockerels.

OZARK POULTRY FARM,

J. V. Frazier, Prop.,

Route 2, PURDY, MO.

PETTIT'S S. C. R. I. REDS

Exaggeration destroys confidence, but temperate statements merit your consideration.

"Not the best in the world," but a sturdy flock, alive with color and strong type, also a surprising number of birds that stand out as exceptional.

Eggs, per 15, \$5 and \$12; eggs, per 100, \$20 and \$50. Chicks, 40c and \$1 each; no less than 25 sold. Males, \$10 up; females, \$5 up.

L. D. PETTIT

P. O. STRATFORD, N. J.

Wants Silver Plymouth Rock Club.

To any breeder interested in the Silver Penciled Plymouth Rocks, the truth in the article by F. L. Platt in the recent issue of the American Poultry Journal can be better appreciated if he attended the recent Boston Show. The class at this show was small, the best birds only fair and the interest in this variety noticeable because of its absence.

Silver Penciled Plymouth Rocks are not more difficult to breed than many of the colored varieties, in fact they breed to color better than most. Why, then has the interest waned in this beautiful bird? The small class in Boston, one of America's leading shows, clearly demonstrated the material decline of the variety and the opinion of several judges of this variety whom the writer has talked with will support the statement. In the opinion of many the breed is not pushed enough. The few remaining breeders of Silver Penciled Rocks have lost interest and in the east the variety is going backward rapidly.

Now, let the year passed be the end of the decadence of Silver Penciled Plymouth Rocks; let us all who are interested as breeders or fanciers of this variety get together and organize and push up the Silvers a little nearer to "Perfection." Let us launch a Silver Penciled Plymouth Rock Club of America, so send in your name and the name of every one interested in the breed. Do it now and get the temporary organization started. Start today and push for better Silver Rocks for next year. Remember I want your interest and name at once.

Barre, Mass.

Clyde H. Swan.

National Show, Chicago.

The National poultry show, held in the amphitheater, Union Stock Yards, Chicago, January 12 to 18, 1921, was a large and well attended event. There were approximately 2,300 head of poultry in competition. This figure includes about 500 bantams, which was an astonishingly big entry of bantams for the west, and exceeded, in point of numbers, the bantam entry at Boston. The National Bantam Association met at the National show this year. As we walked down the aisles we were particularly impressed with the number of Black Cochins bantams entered, and many of them were of superior quality.

In large Asiatics there were no Cochins. But in Light Brahmas, Fairview Poultry Yards, South Portland, Maine, showed an outstanding cockerel that won first. Len Rawnsley took us around to see the wonderful hackle on this bird. The cockerel was a typical eastern bird, and headed the 3d young pen at Boston two weeks earlier.

White Wyandottes numbered 220 birds. The class was a revival of the great competition in this variety at the National four years ago. The quality, however, was a long way in advance of that famous show of 1916. The bulk of the prizes went to Charles V. Keeler, of Winamac, Ind. This breeder showed 64 birds, and the entire string showed quality throughout. We were particularly impressed with his line of males. His cockerels from 1st to 5th, together with those that headed his pens, had backs that carried their width all the way out. Their tails were well spread, carried at the proper angle to give a beautiful Wyandotte sweep to their backs, and the tails were well finished with coverts and lesser sickles. These birds had elegant heads and coach-horse necks. However, the arch of the neck was not merely on the back; on the front, the neat, nicely rounded wattles laid back on a true Wyandotte neck. These cockerels were not coarse in bone or rough in feather. They had wide tail coverts, and their top plumage, which includes hackle and saddle, was of a satiny finish and a silvery white color. There was no excess of fluff from which we would deduct. Indeed, these males are of the most modern type and are a tribute to their breeder. We are not in the business of passing idle comments or handing out flattery. We say to you squarely that Keeler showed a line of males that are the genuine thing.

This breeder also showed a long-bodied hen in the utility class that won 1st and was estimated by three different judges to be a 260-egg hen. We understood that she had a record of 252.

The Silver Wyandotte entry was small.

Barred Plymouth Rocks, as usual at this show, brought out a big number of different exhibitors and some good Barred Rocks. Newton Cosh, who has judged this class for years, wore the duster again this year. Second cockerel, shown by Mr. Stratford, was an elegant chicken. Coop of 1st cockerel was

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil

Kills Lice

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself. J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right. OSCAR THOMPSON, Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now. JOHN HOLTRAP, Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective. HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter. FRED S. WILLIS, Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers. EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried. MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me. J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed. MRS. L. M. JOHNSON, Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles. BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about. L. G. STAYNOS, Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

WELLESLEY, MASS.
ARTHUR G. DUSTON, Supt.

empty and we assume that he was a Jim Dandy to have beaten the Strafford bird.

In White Rocks there was a small entry. H. W. Halbach & Son are deck-sweepers in this variety at this show. It is always hard to get entries for a class that has a sweepstakes winner in it. Their 1st cockerel this year was, in our opinion, the best cockerel that these great breeders have ever shown. We understood that he was awarded the special for the best cockerel in the show.

Reds formed an important class. H. P. Schwab did the judging, and J. C. Johnston remarked on the good way in which the awards had been placed. The 2d R. C. Red cockerel, which won the shape special, was commented on by several breeders as the ideal type for this variety.

Buff Orpingtons brought out a big entry. T. D. Windrom told us that he had cooped twenty pens of Buff Orpingtons. Len Rawnsley did the judging and he was particularly enthusiastic about the 1st Buff cock and 1st Buff hen. He commented on their soundness of color, their evenness of buff color, and the fact that they were useful birds, not encumbered with a lot of useless fluff. These two birds were shown by Leslie Black, proprietor, Bonnie Brae Poultry Farm, Sandusky, Ohio.

First White Orpington cockerel was a good one. Frank Conway won 1st White pullet. He entered her for his little boy, Norman, 3½ years old. He wants the laddie to be a fancier from the start.

In the Mediterraneans, S. C. White Leghorns led the field. These were cooped in a very bright wing of the building. In this connection we want to say that our comment on the 2d White Leghorn cock, in the last issue, was misunderstood by one breeder. A fancier usually describes a bird with his hands, as he talks. In writing, one has to depend altogether on words. What we wanted to say about the 2d Coliseum cock was that he had a wonderful back and tail, and that his tail was not like a thin shingle stuck into his back. Glenn Wilson again won 1st White Leghorn cockerel at the National this year.

M. R. Knox showed a Blue Andalusian cockerel and pullet that are a step in advance. They had the big bodies and station that are winning at Boston and New York.

Frank L. Platt.

Columbian Rocks.

Have been taking your journal for some time but have seen very few articles on the Columbian Rocks. Cannot understand this, as this breed can hold its own with any, and surpasses most of them. I feel assured that if any fair-sized breeder in the middle west should take up this breed he would find his business grow by leaps and bounds. There is not a harder breed. As a table fowl there is none better. For laying qualities they can hold their own with the best of them. A person has only to give them a trial to be convinced of this fact.

As to plumage, just picture to yourself some of the leading varieties alongside of the Columbians. Which would catch your eye first? It would be the Columbians without a doubt. The breed seems to be confined to the extreme east alone. Some middle western breeder is passing up a chance of a life time by not raising them. Have raised this breed for four years but was forced to give them up after trying twice to purchase new blood near here and being stung each time. Any back-lotter who intends to raise poultry will make no mistake if he can get any of this breed nearby. I am raising Barred Rocks now, and while they are all right, still I cannot forget the Columbians, and I am watching the ads closely.

Wisconsin.

John Farell.

The Purebred Breeder.

You well know the purebred breeder

Is an artist, and a skilled one,

Both a worker and a dreamer,

Seeing visions, striving ever,

To produce the best in kind.

Know you that the purebred breeder

Is a landscape gardener also,

Filling meadow lands and pastures

With a bright and gorgeous show

Of the many flowers and blossoms

That each one of us delights in?

In his garden, too, he labors,

He is weeding, culling, sorting,

Like unto his brother gardener,

In the kingdom of all plant life.

For he knows, not every seedling,

In its ultimate unfolding,

Will reach that high attainment

It must needs do, ere he gives it

His approval, approbation.

—Shorthorn World.

THE GREAT BOSTON SHOW.

(Continued from page 157)

ing in the surface of back and in body color.
Buff Cochins—Harvey C. Wood, 1-2 hen, 1 ckl, 1-2-3 pl.

First and 2d Buff Cochins hens, big, profuse feathered birds that look like something, but not as soft buff as of old. First cockerel and 1st pullet about as good as one sees, but only an echo of old times, 1st pullet being bare on middle toes and 3d more or less black in tail.

Partridge Cochins—A. E. Anderson, Bristol, Conn., 1-2 cock, 1-2-3 hen, 1-2 ckl, 1-2-3 pl, 1 young pen, 1 old pen; W. E. Poch, 3 cock; W. F. Worcester, Old Orchard, Me., 4 cock, 4-5 hen.

Mitchell lost 1st and 2d cocks at Boston on way home last year, and lost best cock and best hens en route to show this year. He was still able to make a creditable display. First cock shows the class of this old line. Second cock, tips forward and has the balance that old Cochins breeders want. First hen, a round one; 2d, wide spread on legs; 3d, big. Three true Cochins, with level ground color and thoroughly penciled. Much difference between such hens and 5th, which had a heavy black pencil and moss in ground color. Cockerels young. Pretty hard to arrive at the show with eleven birds smothered to death and still fill the cages. The Mitchell line was entered in the name of Adolph Anderson, who has bred the birds with Mr. Mitchell for many years.

Black Cochins—H. K. Foss, Reading, Mass., 1-2 hen, 1-2 pl.

Black Cochins lack size.

White Cochins—H. K. Foss, 1-2 cock, 1-2-3-4 hen, 1-2 ckl, 1-2 pl.

White Cochins at Boston as good as there are at the present time.

Black Langshans—F. I. Moore, Revere, Mass., 3-4 cock; Burleigh A. Jones, Lakeport, N. H., 5 cock; J. F. Robinson, South Weymouth, Mass., 2 cock, 1-3 hen, 1-3 ckl, 2-3 pl; Thomas Fowler, New London, Conn., 1 cock, 2 hen, 5 pl; F. R. Backus, Pittsfield, Mass., 2 ckl, 1-4 pl.

Some good and some poor Langshans. Wonder that 3d, 4th and 5th cocks ever were allowed to become cocks. Second cock, short in feather, but a really good one. First hen, big, of good color and type, good head, back and tail. First cockerel, typical, shows good breeding throughout. Second, an astonishing bird. Third, big and not as coarse as second. Third pullet a star. Second, a good pullet. Fine sheen on both, elegant backs, tails and heads. Third, especially fine in balance on legs, straight legs and good station. There are all too few good Langshans in the east and there is little hope of more as long as 2d cock and 3d pullet go unrewarded with blue ribbons. First pullet had to be poked under tail to get any shape out of her. Such judging displays incompetence.

Blue Langshans—Sunnyfields Farm, Wallingford, Conn., 1 cock, 1 hen, 1 ckl, 1 pl.

These birds show a nice improvement.

PLYMOUTH ROCKS.

Barred Plymouth Rocks—F. W. Havens & Son, Agawam, Mass., 3 cock; C. D. White, Concord Jct., Mass., 5 cock; Frank Perall, Winsted, Conn., 4 cock, 2-3 hen, 1-4 pl, 2 young pen; Lambert's Poultry Farm, Apopka, R. I., 2 cock; Butterfly Farm, Saylesville, R. I., 1 cock, 2 old pen; Gustave L. Rosen, Lunenburg, Mass., 1 hen, 5 pl, 1 young pen; George A. Bowker, Worcester, Mass., 5 hen; S. D. Bugbee, Concord, N. H., 4 hen; A. C. Stevenson, St. Stephen, Canada, 1 ckl; Fred E. Sherman, Hyannis, Mass., 2-4 ckl; K. Berthold, Saugus, Mass., 3 ckl; C. W. Brown, Vineland, N. J., 5 ckl; Brookside Farms, Great Barrington, Mass., 2-3 pl, 3 young pen, 1 old pen.

Barred Rocks, Pullet Bred—S. D. Bugbee, 3 cock, 2 young pen; John E. Scudder, Centerport, N. Y., 2 cock; H. J. Kennedy, South Weymouth, Mass., 4 cock; George A. Bowker, 1 cock, 3 ckl; Butterfly Farm, 5 cock, 1 ckl; Frank Perall, 5 cock, 1 young pen; K. Berthold, 4 ckl; Bishop Bros., Westerly, R. I., 2 ckl; Walter Hunold, Shawomet, R. I., 1 old pen; C. A. Butler, Whitman, Mass., 3 young pen.

Barred Rocks, Cockerel Bred—Fred E. Sherman, 3 hen, 3 pl; L. J. Upham, Webster, Mass., 4 hen; Lambert's Poultry Farm, 2 hen, 2-4 pl, 1 young pen, 2 old pen; George A. Bowker, 5 hen; C. W. Brown, 1 hen; K. Berthold, 1 pl; Butterfly Farm, 5 pl, 2 young pen; C. W. Brown, 1 old pen.

In Barred Rocks there were entered 14 cocks, 20 hens, 40 cockerels, 22 pullets, 7 pullet bred cocks, 13 pullet bred cockerels, 13 cockerel bred hens, 14 cockerel bred

(Continued on page 188)

Successful Poultrymen use this Feed

SUCCESSFUL breeders write us that no chick feed they can buy or prepare gives the results H-O STEAM-COOKED CHICK FEED does. They can raise a higher percentage of every hatch on this feed because *chicks can digest it*; chicks mature more rapidly and attain a larger size, because it is the right combination of bone and muscle building elements.

Read What Successful Breeders Say

Richland, Pa., Nov. 27, 1920

H-O STEAM-COOKED CHICK FEED stands in a class by itself. No feed we have ever fed started the chicks off so well and developed them so quickly.

I. B. FIRESTONE

Nunda, N. Y., Nov. 27, 1920

We experimented for years but no feed gives the result yours does. H-O STEAM-COOKED CHICK FEED enables us to raise more and better chicks and increase our profits.

S. V. HAINES, Nunda Poultry Farms

Middleburg Center, Pa., Nov. 22, 1920

No one engaged in the rearing of chicks can afford to be without H-O STEAM-COOKED CHICK FEED.

F. H. GEE & SON

H-O STEAM-COOKED CHICK FEED

is a scientific combination of clean, wholesome grains, cracked to a pin-point fineness and steam-cooked by our exclusive process. It saves the lives of baby chicks and starts them right for early egg production.

H-O STEAM-COOKED CHICK FEED is packed in handy five-pound packages, durable, space-saving and just the right size to feed. Also put up in the usual size bags, 100, 50, 25 and 10 lbs.

Insist on H-O STEAM-COOKED CHICK FEED and get the profits from live chicks.

BOX N° A-3, BEREA, OHIO

TRADE

My big Ancona Book, containing 100 pages of practical poultry facts and pointers, for your name and address on the coupon in the corner.

SOME TRADE! All you have to do is to send me the coupon properly filled out and the Book which is waiting for you in an envelope here in Berea, Ohio, will start on its journey to you. All it needs is your name and address.

This Big Book of

mine, which I'm willing to trade for a minute or so of your time and a 2c stamp, is a downright valuable poultry book. This is why I'm trading. I'm anxious to spread the good news about Sheppard's Famous Anconas to the four corners of the country.

Here are some of their good points—and here's their only "bad" point:

They've got the egg-laying habit **so bad** that neither indifferent care nor the icy blasts of winter can keep them from turning out a persistent supply of large, white eggs. Not a "bad" habit for a chicken to have, is it?

These are some of the good points about the "Famous" Anconas.

They are always full of pep and vigor, and too busy laying eggs to think of taking time out to set.

They thrive under conditions of confinement that would cause the ordinary breed to give up in disgust.

They eat less feed—and produce more eggs on that feed—than any other bird in America. This is backed up by government tests—you can bank on it.

They hold the sky-high record of egg production—331 for a single hen, and 256 for a flock.

For 13 consecutive years they have

walked away with every worthwhile prize at the world's grandest shows.

The Big Book has all the rest of the good news—and I'm standing here at Berea ready to hand you your copy of this valuable help to poultry men and women.

Just hand me, thru the mails, the little coupon in corner and this Book will be yours.

This offer holds for anyone who is really interested in poultry.

- ☐ Heavy egg yield
☐ Prizes at shows

To secure your free copy promptly fill out this coupon in full.

Address your envelope to H. Cecil Sheppard, Box A-3, Berea, Ohio.

Dear Mr. Sheppard:

We are interested in "Famous" Anconas primarily for the following reasons (check).

- ☐ Winter eggs

Today's Chicks are Tomorrow's Checks

On what you do NOW to prevent loss of chicks depends the percentage that will live and be profitable to you. They don't grow into money in unsanitary, disease-developing, mite-infested living quarters.

Use **CARBOLA**
The Disinfecting White Paint

Instead of Whitewash and Disinfectants

Carbola is the most effective as well as the cheapest and easiest way to obtain the necessary sanitation. It is a paint in powder form which contains a germicide many times stronger than pure carbolic acid. A peeling whitewash means not only loss of light, but loss of the disinfectant sprayed on the whitewash that peels off. Carbola does not peel or flake—it stays on the wall, a day and night guard.

Makes it Easier to Do Work that Must Be Done

The Carbola powder is mixed with water and ready to apply in less than five minutes. Apply with brush or sprayer to wood, brick, stone, cement or other surfaces, or over whitewash, in stables, poultry houses, hog pens, cellars, outbuildings—wherever you have been using whitewash and disinfectants or just whitewash. A gallon (a pound of the powder) covers 200 square feet. Also an excellent lice powder—use it in the dust bath.

Your hardware, paint, drug or seed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Satisfaction, or money back.

10 lbs. (10 gals.) \$1.25 and postage. 20 lbs. (20 gals.) \$2.50
50 lbs. (50 gals.) \$5.00 delivered.

pullets, and 13 pens. The judging of this class impressed us as one of the most consistent pieces of work in the show. All breeders might not agree with the judge on the birds that he selected, but the judge followed well defined types.

First cock, fully feathered, no split tail, legs in show condition, not as straight barring as we have seen, but a real chicken. Winning cockerels were of medium size. Birds that were big but had too much size and feather for their weight when handled, did not get under ribbons. Cockerels that were placed were finished, not chick feathered. First pullet bred cockerel finished in tail the same as the 1st exhibition cockerel. F. G. Cook said that no cockerel at Chicago would have got in here. His criticism on the west was "roughness of class. The breeders do not know whether they are going to show or not until about the time the entries close," said he. It is true that New England breeders grew all year for Boston.

Some dark metallic over tails of 2d and 4th cockerels, but is that not better than bare, unfinished tails which no one knows how they will finish? Winning cockerels closed over tail, not split; not long, lanky legs; solid, finished birds.

"Pullets not as good as at Chicago," said Mr. Cook, who judged Chicago. Consistency of barring not emphasized in females. Second prize pullet, wide barring on shoulder of wing, narrow on back; making two different kinds of barring on bird. Wings were well formed. New England breeders want meat on the wing, which overcomes twisted wings, and they want the flights to grow out evenly and be firm. This younger set of New England breeders is laying much stress on formation. We shall watch with much interest the development of the variety in their hands.

It was like old times to see Arthur C. Hawkins, Victor Bradley and Dan Lambert in the Barred Rock aisle.

White Plymouth Rocks—H. E. Forkey, Worcester, Mass., 1-2 cock, 4 hen, 1 pl; F. A. Brown, Brockton, Mass., 5 cock, 3 hen, 2-5 chl; Mirimichi Poultry Farm, Foxboro, Mass., 3-4 cock, 1-2 hen, 1-4 chl, 2-4 pl, 1 young pen; Warren P. Fitz, Salem, Mass., 5 hen, 3 chl; H. K. Chadwick, Oak Bluffs, Mass., 3-5 pl; Silverwood Farm, Holiston, Mass., 1 old pen.

A typical Boston showing of good White Rocks—7 cocks, 18 hens, 20 cockerels, 15 pullets, 2 pens. First cock had beautiful top line, good head, carriage of wing, length of saddle, carriage and furnish of tail. Second cock, lower in tail and split somewhat. First and 2d hens, a pair of good ones. Third hen, elegant type and condition of feather, but creamy. Fourth hen, ordinary, and not in good condition over cushion and tail.

First cockerel, a taller bird than Barred Rock men in New England are going in for. First, 2d, 3d, 4th, 5th cockerels same style in tail, nice feather over tail, and main tail not split open but closed together; bright, clear cut heads; legs well placed, and not heavy boned shanks that knock together at knees. Pullets not so good as we would like. First, big, all-round bird. Second, young, but by long odds the most promising. Third, too long in head. Fourth, a good pullet. Fifth, weak at knees.

Buff Plymouth Rocks—E. J. Goodrich, Wallingford, Conn., 4 cock; Charles E. Coffin, Providence, R. I., 3 cock, 5 hen, 2 old pen; Kingman Farm, Randolph, Mass., 2 cock, 1 old pen; C. W. Gould, Greenwood, Mass., 1 cock, 2 hen; Ashline & Croft, Fitchburg, Mass., 5 cock, 3 hen, 1-3 chl, 2 pl, 2 young pen; Charles Olliver, Barre, Vt., 4 hen, 4-5 chl, 1-5 pl; L. E. Curtis & Son, Freeport, Me., 1 hen; B. N. Duclos, Lenox, Mass., 2 chl, 3-4 pl; L. D. Ackerman, Greenwood, Mass., 1 young pen.

In Buff Rocks, 8 cocks, 11 hens, 10 cockerels, 9 pullets, 3 pens. A mediocre class of cocks. First and 2d hens, birds of value, level color, clear wings and tails. First cockerel, a fine sheet of rich, level top color; a good cockerel. Second, badly cut away in breast. One of the best cockerels left out. Said by the judge to be too light in color. First pullet, soft, bright color; a well built pullet. Fifth, a good pullet, similar to first; little pepper in tail. Third, young; 4th, a little shafty.

Partridge Plymouth Rocks—Paul Klingbeil, Walpole, Mass., 1-2 cock, 2-4 hen, 2-3 chl, 2-4 pl, 1 old pen; William L. Allen, Chestnut Hill, Mass., 4 cock, 1 hen, 1 pl; J. F. Southwick, Blackstone, Mass., 3 cock, 5 hen, 5 pl; Herman R. Sweet, Attleboro, Mass., 3 hen; George H. Hendry, Mattapan, Mass., 1-5 chl; Mrs. A. P. Wilcox Heath, Stonington, Conn., 4 chl; W. F. Worcester, 3 pl.

Four cocks, 5 hens, 9 cockerels, 8 pullets, 1 pen. Some of the cocks as rough as pig iron.

CYCLE

Hatches
Better
Chicks

The Cycle helps to make the small poultry business profitable. It is a low cost, simple and efficient hatcher. With it you can hatch and raise a good flock of profitable birds, for you can hatch whenever you have the eggs ready—no waiting for setting hens. Hatch a good flock of early chicks—it is not only nature's most favorable growing season, but they mature in time to keep the egg basket filled all winter—nothing like early pullets for plenty of winter eggs.

Write us today for one of these machines—no delay—we have them ready to ship. If desired we send by parcel post C. O. D.—you pay the postman on arrival.

These points in the Cycle will appeal to you:

Because it follows natural principles. These points found in the Cycle will appeal to you. They are vital to success. **FIRST:** The heated air is applied on top of the eggs only, as under the hen. **SECOND:** No direct air passes through the hatcher to carry off the natural moisture in the egg. **THIRD:** Being circular, with the lamp in the center, the radiation is equal throughout the machine. **FOURTH:** The heat is brought close to the eggs, with no waste of heated air space. **FIFTH:** The eggs are turned and cooled similar to nature's way. **STUDY** the hen and investigate the CYCLE. It will pay you!

A New Free Book you will want:

"A Profitable Home Poultry Plant"

Our new book, "A Profitable Home Poultry Plant," describes our new methods of poultry keeping—contains many ideas you can put to practical use in your own poultry work. New ideas and suggestions for feeding, for profitable care and management, hatching and brooding, selecting stock, etc. We will send you a copy free.

With this book, we will also send you our new 1921 catalog of Cycle Hatchers and Brooder-Hatchers, Fireless Brooders, Laying Houses, Brooder Coops, Feed Saving Hoppers, Fountains, Troughs, Leg Bands, etc. A complete line of poultry supplies that will help you make the most from your poultry.

Write today for this new free book and a copy of our catalog. A postal will do. We want to tell you about our new methods.

What Others Say:

Moweaqua, Ill., Feb. 16, 1920.

Gentlemen—I have used the Cycle Hatchers for nine years and can sure recommend them, as I have hatched as high as 47 from 50 eggs. Yours truly,

James W. Smith,
White Leghorn Breeder.

Gladwater, Tex., Feb. 19, 1920.

Gentlemen—I have used your Cycle incubator seven years. Have better hatches than with any other machine I've used, and I have used several. Respectfully,

J. G. Cox.

R. 3, Fairmont, Ind., Mar. 1, 1920.

Gentlemen—My mother has used one of your small Hatchers for years and likes it fine. Please send me your catalog.

Respectfully,
Mrs. Chas. P. Kibbey.

THE CYCLE HATCHER. Holds 50 eggs, all metal construction. A simple, practical, safe and efficient incubator, complete, ready-to-use. (Weight for parcel post shipment, 17 lbs. Postage extra.) Price..... **\$9.00**

THE BROODER-HATCHER. A 50 egg Hatcher and Brooder combined. One lamp serves both purposes. All-metal, a remarkable Hatcher and a fine brooder. The popular machine for the small flock poultry keeper. (Parcel post weight 18 lbs. Postage extra.) Price..... **\$11.00**

We also manufacture and sell "Ready Built" Philo System Coops, for laying hens, breeding stock and baby chicks, and a complete line of poultry supplies

First hen, too small feathers for penciling to show off. Second hen, big and cobby. Third, built like a single comb Wyandotte. Fourth, a fair hen, not enough Rock type. Fifth hen, about the largest feather in class, too dark in hackle. In cockerels, 1st was the best all-rounder, with 2d the color king. First pullet, like 1st hen, lacked richness of ground color. Third pullet, dark and indistinct. Second, good type, good penciling and richness of ground color.

Silver Penciled Plymouth Rocks—Fred F. Field, 1 cock, 1 hen, 2 ckl, 1 pl, 1 old pen; Clyde H. Swan, Barre, Mass., 1 ckl, 2 pl.

A sad showing.

Columbian Plymouth Rocks—Henry L. Wilbur, Tiverton, R. I., 1-2-3 cock, 1-2-3 hen, 1-2-3-4-5 ckl, 1-2-3-4-5 pl, 1 young pen, 1 old pen; Howard M. Monroe, Lexington, Mass., 4 hen, 2 young pen.

Columbian Rocks show a pleasing advance over any class that has heretofore been shown. Three cocks, 4 hens, 10 cockerels, 7 pullets, 3 pens. First cock, a clean colored bird, good substance, nice type. First, 2d, 3d, 4th, 5th cockerels free from brass, good quality birds, and five better ones have not been shown by any breeder. First pullet, white body, good neck, tail and wings; true Rock type. This entire line has a sharp eye, pronounced in richness of color. Brass is being eliminated by breeding slate under color. These beautiful birds should make many new friends, for they are well worthy of having.

WYANDOTTES.

Silver Wyandottes—F. H. Davey, Vineyard Haven, Mass., 4-5 cock, 1-2-3 hen, 1 ckl, 2 pl, 3 young pen, 1 old pen; R. G. Williams, Barre, Mass., 3 cock, 1-3 pl, 2-5 young pen; Dr. H. R. Bristol, Bennington, Vt., 1 cock, 2-3 ckl, 1 young pen; A. & E. Tarbox, Yorkville, Ill., 2 cock, 5 hen, 4 ckl, 2 old pen; W. F. Garland, Ottawa, Ont., Can., 4 hen, 5 pl; M. Adelman, Norwood, Mass., 5 ckl, 4 young pen; N. C. Rublee, 4 pl; Allen Blodgett, Cobleskill, N. Y., 3 old pen.

Larger classes of Silver Wyandottes have been cooped on rare occasions, but never a better class in any showroom in America. The best breeders were competing, with birds from the west and from Canada. Fourteen cocks, 17 hens, 21 cockerels, 23 pullets, 7 pens. First cock, wonderful open striped back, finest lacing around edges of secondaries we ever saw; wing bar not so good; elegant fluff lacing. Second cock, good all-round bird. Third wins shape special and is a silvery white bird on top.

First, 2d, 3d hens, big without being coarse; full of life and action, not little round specimens. Large feathers that show off lacing, and a thinness of texture that is almost transparent, allowing the lacing of one feather to almost show through the white center of another. Second hen, light in flights, but what does that matter? Lacing is the property of this variety, and why ask for a Dark Brahma wing?

A wonderful lot of cockerels. First has true type, silvery white top color, well laced hackle and good back. Second cockerel also carries good type, but lacks in hackle striping and will probably show some rust later. First, 2d, 3d pullets, good, but not equal to 1st, 2d, 3d hens. First pullet showing a little frosting on back. Fourth pullet weak in the black of the lace. George Weed judged this class and gave excellent satisfaction. Davey said that he had had quite a trade in good hens, some Silver buyers paying \$50 for a good one. Quality is what they all want.

Golden Wyandottes—George G. Stevens, Worcester, Mass., 2 cock, 4 hen; O. P. Chase, Andover, Mass., 1 cock, 3 hen, 1 ckl, 4 pl; Melvin F. Uphoff, Bound Brook, N. J., 3 cock, 1 pl; George M. May, Andover, Mass., 1-2 hen; George Newhouse, Boston, Mass., 2-3 ckl, 3-5 pl; J. Garfield Mills, Natick, Mass., 4 ckl; H. O. Emmons, Chelsea, Mass., 2 pl.

Golden Wyandottes brought out some nice specimens. Three cocks, 4 hens, 4 cockerels, 5 pullets. First cock, good type. Second cock, level color and rich bay ground color. First pullet, very attractive, with rich bay ground color.

White Wyandottes—J. W. Andrews, Dighton, Mass., 4 cock, 2-4 hen, 1 old pen; F. H. Davey, 2 cock, 1-4 ckl, 3-4-5 pl, 1 young pen; Arthur H. Shaw, Wellesley, Mass., 5 cock, 5 hen, 2 young pen, 2-3 old pen; C. W. Diggle, Plainville, Conn., 3 cock, 3 hen, 4 young pen; O. L. Golder, Wakefield, Mass., 2-3 ckl, 2 pl; Clifford Taylor, South Braintree, Mass., 5 ckl; J. J. Lynch, Westport, Conn., 5 young pen; Mirimichi Poultry Farm, Foxboro, Mass., 1 cock, 1 hen, 1 pl, 3 young pen.

White Wyandottes were one of the strongest classes in the show—25 cocks, 28 hens,

It's What You Raise That Counts

It's Not What You HATCH!

The loss of little chicks, as most poultrymen know, is enormous; ranging from 25% to 75% of almost all hatches. Most of these losses are preventable, if you feed for the first eight weeks

Conkey's The Original Buttermilk Starting Feed

The digestive organs of a little chick are extremely sensitive, and the least disorder quickly results in disease and death. Conkey's Buttermilk Starting Feed is an appetizing combination, scientifically proportioned, of pure sweet grain and concentrated sanitary Buttermilk. The lactic acid of buttermilk strengthens and tones up the sensitive digestive organs of the little chicks and helps prevent White Diarrhea. Conkey's is different from all other chick feeds. It builds strong, sturdy chicks that grow into heavy layers, good breeders and full-bodied market fowls. It costs so little for those first eight weeks that no chick raiser can afford to be without it. If you don't find Conkey's Buttermilk Starting Feed at your dealer's, write us and we shall tell you where it can be secured. Booklet FREE.

HAROLD TOMPKINS'

SINGLE AND ROSE COMBS

**RHODE ISLAND REDS**

FANCY AND UTILITY BIRDS

Oldest Line Bred Flock in the World

More than a half century ago my grandfather started linebreeding Rhode Island Reds to produce birds with long, deep bodies and an even shade of red, that would lay large brown winter eggs. He thus established the characteristics that have made this breed the greatest business fowl of the world and laid the foundation of the famous TOMPKIN'S STRAIN.

Leading Rhode Island Reds of the World

The records of my birds in the show room throughout this country for years furnish absolute proof that they stand supreme.

First Pen Cock Madison Square Garden, 1920

Exhibition Birds

Again Tompkin's Reds demonstrate their superiority. At the two big Red meets of the country they won:

BOSTON 1920-1921, on Single Comb.

3-4-5 cock; 1-3 cockerel; 1 hen;
3 pullet; 1-2-3 young pen; 1-2 old
pen; best display

ROCHESTER, N. Y., 1921, on Rose Combs.

1-8-10 cock; 1-2-3-4 cockerel;
5-8-10 hen; 3-4 pullet; 2-4 young
pen; 2-5 old pen; best display;
champion male.

If you want to win at your show send to me for your winners. Thousands to select from. Single birds and pens now ready for any show in the country.

Breeding Birds

Years of systematic breeding has so perpetuated the blood of these birds with the true Rhode Island Red type and rich velvet red color that they reproduce themselves and are unexcelled for new blood or foundation stock. My years of experience are at your service in making a selection that will help and please you.

Hatching Eggs

My matings this year are better than ever before. All birds in these pens are rich in the blood of my Madison Square Garden, Boston, Rochester and Kansas City winners. Send for mating list which describes these matings.

Headquarters for Everything in Rhode Island Reds

If you intend to buy Rhode Island Reds you will save time and money if you will come to headquarters. You are assured of complete satisfaction in all dealings with me. Write your wants to

"Successful" Grain Sprouter a Money Maker and Money Saver 365 Days in the Year

Feed Sprouted Oats Easily—quickly—
easily—economically produced in "Successful" Sectional Metal Grain Sprouter. Get greater fertility in winter laid eggs—earlier chicks. Make three bushels of tempting egg-making feed from one bushel of oats, wheat or rye—increase the egg yield at least 50 per cent—and at same time save one-third feeding cost. Write for catalog and 1921 offer we make on the

"SUCCESSFUL" SECTIONAL ALL-STEEL GRAIN SPROUTER

Made with double steel walls—metal trays—nothing in it to warp, shrink, swell or mold the food. Fireproof. Lasts a lifetime. Large glass doors. Made in sections so you can add more sections as your needs grow. There's a size for your needs whether you keep 50 or 600 hens. Thousands of poultry raisers say they would not be without this wonderful food maker. The newest, most reliable construction ever made in a grain sprouter. Not only turns idle hens into industrious layers but supplies feed for growing chicks—protects health—prevents chick loss. Booklet—"How to Raise 48 Out of 50 Chicks"—10 cents.

Write today for catalog and full details of 1921 offer

LILY WHITE POULTRY FARM

R 1

COMSTOCK PARK, MICH.

33 cockerels, 37 pullets, 12 pens. First cock was white, satiny finish, tail finished, elegant head, strong bird. Second, elegant head, tail covered over with one mass of coverts that overlap. These cocks are wonderful—not too short, not overdone in any particular. First hen, a very typical female; good in all sections and well balanced. Second hen of same type and worthy of highest commendation.

First cockerel, a hard bird to fault; silvery white, good head, back, tail and underlines; wonderful balance. Second cockerel, high in comb, pinched in tail. Third, short in thigh and tail not finished. Much better cockerels unplaced than 2d and 3d. Fourth, same kind of a chicken as 1st, but little heavier in fluff and not so good in comb.

First pullet, a good one; little harder feathered than 3d, 4th and 5th, but shows line of demarcation between wings and cushion. Second pullet, too long in head and tail. Third, 4th and 5th pullets, wonderful. The only point that can be raised is that they will make hens that may be a little too full of feather. First young pen, good; 2d young pen, good. First old pen has a couple of small females that pinch their wings into their cushions; 2d old pen, good. Sabrina Farm had its usual exhibit of birds in a large booth. This exhibit did much for White Wyandottes; in fact, there were as many people in the booth as in the White Wyandotte aisle, for it is one thing to see show birds in competition and another to see sales birds that a man can take home with him.

Black Wyandottes—George Newhouse, 2 cock, 1-3 hen, 1-2 ckl, 1-2 pl; W. F. Worcester, 1 cock, 2 hen.

A small entry of Black Wyandottes. First cock, good. First hen, truly fine Wyandotte hen. Second hen, only yellow legs in class. Third hen, too long. Cockerels small.

Buff Wyandottes—C. H. Coburn, Manchester, N. H., 1 cock, 2 pl, 2 young pen; J. J. Dansro, North Clarendon, Vt., 2-3-4-5 cock, 1 hen, 1-2-3 ckl, 3-4 pl, 1 young pen, 1 old pen; E. W. Guild, Holliston, Mass., 3 hen, 1 pl; Elmpines Farm, New Rochelle, N. Y., 4-5 hen, 2 old pen; Stuart A. Howland, Granville, N. Y., 2 hen; Fred Rockwood, South Brookline, N. H., 4-5 ckl, 5 pl.

Of Buff Wyandottes there were 13 cocks, 11 hens, 17 cockerels, 15 pullets, 6 pens. First cock, good type, level color, lustrous surface, clean tail, but not well spread tail; fairly good head. First hen, a rich colored, live colored hen, clear buff wings and tail; something of a revelation for the hen class, and there was no question about her being a hen. When you get hens that have the fine color of pullets, you have a sheet of color that is valuable, for it has not faded or become patchy.

First cockerel, a rich, level colored cockerel, poor comb, good type. First pullet had remarkable Wyandotte type, but breast, while one shade of color, was of a lighter tone than neck, wings or back.

We are not criticizing just for the fun of poking holes in the chickens that were at Boston, but to show that, after all, the birds are only the product of human beings who breed the best they can, but who do not produce perfection; and we feel that the average man who has birds of his own, and who is sensible of their faults, wants to know something of the defects as well as the good points of the winners in the big shows.

Partridge Wyandottes—B. H. Young, Bar Harbor, Me., 3-5 cock, 1-4 hen; F. W. Guild, 1-4 cock, 3 hen, 1-5 ckl, 4 pl; W. F. Worcester, 2 cock, 5 hen; J. N. Hazlett, Marianna, Pa., 2 hen, 2-3 ckl, 1-2 pl, 1 pen; George H. Rhodes, Edgewood, R. I., 4 ckl, 3-5 pl.

In Partridge Wyandottes there were entered 8 cocks, 8 hens, 8 cockerels, 7 pullets and 1 pen. First cock was a bright colored, well formed bird. Second, smaller and not as well finished. Third, too much cotton between saddle and roots of tail. First hen, a nicely penciled little hen of good shape. Second, more substance than 1st, but not as cleanly penciled. Both 1st and 2d cockerels, a little long on legs. First pullet, good type and nice penciling for pullet; exceptional penciling in fluff.

Silver Penciled Wyandottes—Fred F. Field, 2 cock, 1-3 hen, 2 ckl, 1 pl, 1 old pen; F. W. Rogers, Montello, Mass., 1 cock, 2-4-5 hen, 5 ckl, 3 pl, 1 young pen; A. L. Hathaway, Abington, Mass., 3-4-5 cock; C. H. Pope, Brockton, Mass., 1-4 ckl, 5 pl; Albert Brust, Scranton, Pa., 3 ckl; Rambleton Farms, Buzzards Bay, Mass., 2-4 pl.

There was a big surprise in the fine entry of Silver Penciled Wyandottes—8 cocks, 13 hens, 10 cockerels, 13 pullets, 2 pens. First cock had good type and head, sound black breast, fluff and tail, Standard color wing

Poultry Raisers

You Can Make Big Money With A Champion Belle City

It's a time and labor saver—low in cost—economical—convenient—durable—easy to run—with a record for sixteen years of unfailing service in the hands of over 871,000 satisfied users everywhere.

Get into this interesting, profit-paying business now, you can't lose; it's money for you right from the start. If you are raising chickens in the "old hen way," you are losing valuable time and money, and missing a big

opportunity. Investigate my proposition without delay. Write me today for Free Book, "Hatching Facts." It tells of the many advantages and how easy it is for all of my customers to make extra big profits with my

\$15⁹⁵ 140-Egg Champion Belle City Incubator

The Prize-Winning Hatcher with Hot-Water—Round-Cornered Rust-Proof Copper Tank—Self-Regulated Safety Lamp—Thermometer and Patented Holder—Double Door—Deep Chick Nursery—Egg Tester—with Fibre Board, Double Walled Construction that

has led the field for sixteen years. Simple—Safe—Sure. When ordered with my \$9.95 Hot-Water, Double Walled 140-Chick Belle City Brooder with Safety Lamp—Guaranteed to raise the chicks—making your Hatching Outfit complete—Both for only . . . **\$23⁹⁵**

Freight Prepaid East of Rockies Towards Express

And allowed to points beyond. I ship from Buffalo, N. Y., Kansas City, Mo., Minneapolis, Minn., or Racine to insure quickest delivery. For 16 years my big factory here at Racine has been devoted entirely to the manufacture of this—one size—one style Incubator and Brooder, and I know

this Hatching Outfit will bring you the biggest hatches of strongest chicks—the greatest profits—with least effort and at lowest cost—vouched for by over 871,000 successful Poultry Raisers everywhere. Hatches Chicks, Ducks, Turkeys and Geese equally well—therefore

You are Perfectly Safe in Ordering Today

Thousands order direct from my advertisements every year. And you get the Belle City at my lowest factory prices—based on actual cost of production. You save the middleman's profit—I ship the day remittance is received.

With this Guaranteed Hatching Outfit and my complete Guide Book for setting up and operating, your success is assured. Besides the big hatches of strong chicks you are sure to get, you can easily share in

My Personal Prize Offers of \$1000 in Gold

No one else provides such easy ways for you to earn extra money. Full particulars come with my Free Book, "Hatching Facts." It also gives newest ideas, easiest plans and quickest ways to make poultry pay big. Time means money to you now—the early broods pay best. Baby Chicks

A Million for 1921—20 Varieties

Get your baby chicks from MILLER by mail this year. Don't bother with hatching them yourself. MILLER Baby Chicks are shipped on a guarantee to reach you safely and assure you results better than the best hatch you could hope to get yourself. You can select from the MILLER catalog, showing 20 leading varieties. Your chicks are shipped to you, one day old when they leave the hatchery, and on a guarantee that protects you from loss. MILLER Chicks were successfully shipped to 46 states last season—states as far away as Connecticut and Western Coast States.

FREE Catalog

We have a copy for every customer of the Miller Hatcheries last year, and every reader of this paper interested in chicken raising. Write for yours now.

Hundreds of letters like these are received every year from pleased buyers of MILLER Baby Chicks in all parts of the U. S.

Greenfield, Ohio, April 6, 1920.

Miller Poultry Farms, Lancaster, Mo.
Gentlemen—The chicks arrived O. K. Certainly a fine lot. Every chick seems to be a prize fowl. It will give me pleasure to recommend your farms. Will order more later.

F. L. Brown.

Blackfoot, Idaho, July 12, 1920.

Miller Poultry Farms, Lancaster, Mo.
Gentlemen—Received baby chicks on the 8th of July all in good condition and are sure nice. Have not lost a single one yet. Am more than pleased with them.

Mrs. W. A. Parsons.

Randolph, Iowa, May 26, 1920.

Miller Poultry Farms, Lancaster, Mo.
Gentlemen—Received the baby chicks this morning all O. K. All alive and ready to run. Am well pleased with them. The first ones we got are doing fine. Many thanks to you.

Miss Kate Gee.

Raise your flock this season from MILLER Baby Chicks. Relieve yourself of all the hatching troubles, losses from poor eggs, small hatches, and even total failures that frequently come to the chicken raiser. Miller Hatcheries are among the largest and best equipped in the United States. Capacity 250,000 eggs at a setting. MILLER knows how to hatch and ship healthy baby chicks and guarantees safe delivery. All chicks shipped parcel post, charges prepaid. Get the MILLER catalog NOW.

Tom Barron S.C. White Leghorns

are still the leading strain of real layers. We breed them exclusively, and have kept them pure by importing each year since 1915 from 5 to 30 birds. We are booking orders now for eggs and baby chicks. Better write today for the 1921 mating list. A few good early cockerels left at \$4 each.

Coleman Miles Egg Farm

Poc A

Mt. Carroll, Ill.

flights, lustrous green wing coverts that form the wing bar, clear white wing bow; fails in hackle striping. Second cock, extra good type, being better in tail than 1st, fails in wing bow, having a smudge of black on the bow. Fourth cock, attractive in all but wing bow; has the best hackle in class.

First hen, a bird of good substance, head and type; very distinct penciling, but ground color has a tone of brown in it. The penciling on the hens as a whole was a revelation, but better hackle striping and clearer steel gray ground color are desirable.

Some of the cockerels are too long in legs. First, clear top color, good wings, but fails in saddle striping. Second cockerel fails in under color, has a slight tendency to straw color on top; has strong saddle striping. Both 1st and 2d cockerels, sound black in breast and fluff.

Silver Penciled Wyandotte pullets made quite an imposing appearance. First had best steel gray color. Pullets get better penciling when they molt into hens.

The revival of interest in this variety is largely due to the promotion work and good counsel of F. W. Rogers, and serves to illustrate what one hundred good fanciers in one hundred parts of the country could do for any one of the varieties. There is one thought that we would like to leave with these breeders. You are starting new. Do not travel up the alley of under color. Get out on the highway of type and surface color. What if your males are light underneath? It is natural in all wild fowls for the color to run lighter as it approaches the skin. Dark under colored males mean smoky females. Dark under color positively means double mating. If you can breed birds that are ideal, birds that will score 100 points in all save under color, why not take the perfect bird, except for the one point cut for white under color in neck, back, breast and fluff? That means a 96-point bird, and such a one is good enough.

Columbian Wyandottes — J. A. Brackett, Mattapan, Mass., 3 cock, 1 hen, 2 ckl, 1 pl; C. C. Smith, Vineyard Haven, Mass., 4 cock, 5 ckl; James E. Perkins, West Stoughton, Mass., 1 cock; George Lyman Hall, Dudley, Mass., 5 cock, 3 hen, 3 pl, 1 young pen, 1 old pen; Gilbert Poultry Farm, Haverhill, Mass., 2 cock, 2 hen, 5 pl, 2 young pen; Ralph Woodward, Grafton, Mass., 4 hen, 1-3 ckl, 2 pl; H. A. D. Leggett, Winooski, Vt., 5 hen, 4 pl, 3 young pen; J. W. Gilbert, Haverhill, Mass., 4 ckl; F. A. Dexter, Orange, Mass., 4 young pen, 2 old pen.

The Columbian Wyandotte show at Boston is the best in the country. This year there were 15 cocks, 14 hens, 18 cockerels, 16 pullets and 6 pens. The quality at Boston is usually infinitely better than anywhere else. New England has for years held the reputation of knowing how to handle the Light Brahma color pattern. First cock won color and shape special, and never was a cock more worthy of it. Second cock, on same order, but not as clear in breast in front of wings. Neither 1st nor 2d cock had heavy black stripes in back, but each saddle feather was striped with an open V-shaped stripe, while the back, directly on top, was silvery white.

First Columbian hen, extra good type, clean body color, not extra good wings; hackle stripes not clearly edged with white at lower points. Second hen, little longer, equally well laced tail, white body, broad hackle feathers clearly edged, excellent wing.

First cockerel, good type, decidedly wide in comb. Second cockerel, little smutty on edges of hackle, but a remarkable bird. Saddle striping of 1st and 2d cockerel like that of 1st and 2d cock. The day of striped backs and white saddles has passed, as has also the day of solid black stripes. The proper thing in males is the V-shaped stripe in saddle hangers, the stripe breaking into white before the under color is reached, and the under color running into white at the skin. A round center on top of back, practically free from stripes.

Last year the weak spot in the Columbian Wyandotte class was the winning pullet. This year the winning pullet was a decidedly superior specimen. Second pullet was honestly shown, the whitish tail coverts not having been plucked, which did not permit her tail to show off. We believe a little more fitting not only legitimate but desirable. Remarkable width of neck feathers. Some of the lower hackles an inch wide. The true Brahma character is not found in a perfect black center correctly edged with white, but in a breadth of feather that sets off the black neck laced with white. The trouble with the Columbians has been too narrow a feather. After some consideration, we believe it fair to say that 2d pullet is the most valuable

Hatch with Electricity

Lectro-hatch
Electric Incubator
Element

Convert your Old Incubator into a Modern Electric

Easily installed. Steady, even heat. Needs no watching. No fumes. More and better chicks.

Why worry along with the fuss, dirt and inferior results of an oil or coal incubator, when you can so easily and so cheaply convert it into a clean, modern, dependable electric machine?

It takes but a few moments to put the Lectro-hatch Electric Incubator Element into your old machine, and there you are—ready to hatch with electricity.

Think what it means to turn an electric button and let electricity hatch your chicks in an incubator that regulates its own heat and needs no watching.

Clean, Convenient and Always Dependable

The Lectro-hatch is so clean, simple and odorless that you can keep it anywhere in your home. It has no lamp to fill, no wick to trim, no smoke, no soot, no risk of fire or explosion. It automatically regulates its own heat and needs no attention whatever, except the turning of eggs when desired.

So far as temperature is concerned, you can go away and leave it for days at a time. When you come back, the weather may have changed, the room may be cold, but the temperature in your incubator will be just exactly what it was when you left it. You adjust the Lectro-hatch to any temperature you want and it maintains that same steady, even heat all the time, until you're ready to change it or shut it off.

Bigger Hatches of Healthier Chicks

Remember, with the Lectro-hatch, there is no smoke or poisonous gas to stunt or kill the chicks in the shell. Fresh, pure air circulates constantly. There are no cold corners, no ups and downs in the temperature. The largest, most successful poultry raisers in the United States will tell you, from experience, that day-old chicks from Lectro-hatch machines have the appearance of being one week

old. They are bigger, livelier, healthier in every way. And it is not uncommon to hatch 80 to 90 percent of the fertile eggs in the Lectro-hatch.

Easy to Install, and Even Easier to Operate

We send plain and complete instructions for converting your machine into an electric. You don't have to know a single thing about electricity to install the Lectro-hatch or to run the incubator. Bore a hole and drive a few tacks—that's all there is to installing it. Turn a thumb nut until the thermometer shows just the degree you want. After that, our patented Regutroller automatically holds that temperature for you, absolutely steady and even.

Lectro-hatch Elements are made to fit any size or style of machine. They attach to any electric light socket, and operate from any kind of electric current—from farm lighting plant, traction line or town lighting systems.

Costs Very Little

The cost of a Lectro-hatch Element is small, and the expense of operating it figures about the same as for a good grade of oil. But, oh, what an enormous difference in hatching results, in cleanliness, in ease, convenience, and peace of mind.

Hatch With Electricity This Year

If you are interested in electric hatching, write us at once. We can supply either the element to convert your old machines or complete new Electric Incubators and Brooders. The same wonderful principles are in both—steady, even, dependable heat; no worry, no work, no watching, no smoke, no gas, and absolute assurance of bigger hatches and better, healthier chicks.

Investigate electric hatching—the most wonderful development in the poultry industry. Write to-day for complete information.

Electric Controller Co., 410 E. 10th St., Indianapolis, Ind.

Read What Leading Poultry Raisers Say About It.

Will Increase Lectro-hatch Capacity and Eventually Use Nothing Else.

"We are glad to say that the electric heating system installed in our Mammoth Incubators was entirely satisfactory, the percent of hatch being very much increased and the chicks large and strong. We hope to be able to increase our Lectro-hatch capacity each year and eventually use nothing else."
—PORTERFIELD HATCHERY, Richmond, Indiana.

U. R. Fishel, World's Leading White Rock Breeder, says:

"We are the first to use exclusively in our Mammoth Hatchery of 18,000 capacity, the wonder element, ELECTRICITY. Not only does this method of incubation hatch stronger chicks, but it hatches larger ones. They really look like week-old chicks as hatched by the old method of incubation."
(Note: Mr. Fishel uses Lectro-hatch.)—U. R. FISHEL, Fishelton Farms, Hope, Ind.

Large Commercial Hatchery Pleased with Lectro-hatch.

"The two machines we fitted with your Electric Element are working splendidly. The absolute safety in their operation, with the better hatched chicks and the elimination of all worry over regulation of temperature, regardless of weather changes, brings to the hatcher as near a perfect incubation device as seems possible. We hope shortly to install more machines fitted with your appliance."
—SNOWFLAKE HATCHERY, Indianapolis, Ind.

Judge Walter C. Young, A. P. A. Judge, Supt. Moraine Farm, Dayton, O., says:

"Never have I operated a machine that holds such an even temperature, all through the hatch, as the Lectro-hatch. And the most pleasing feature of all is the size, weight and vigor of the chicks as they come out. Last year we hatched 75 percent of all fertile eggs left in the machine. One hatch in particular we brought out 83 chicks from 85 eggs."
—WALTER C. YOUNG, Supt. Moraine Farm, Dayton, Ohio.

The MAGIC Brooder

Self-regulating; efficient and high-grade throughout; built with top and bottom draft; gas-proof chamber (the only brooder with this improvement), rocker grate and improved regulator. Will brood strong, vigorous chicks. Reader, the success of raising poultry depends

on the brooder. It must hold the fire and never go out. You only have to kill a chick once to be dead. Even one good chill will ruin them for life.

Buy the Magic—the most dependable brooder in the world; it insures success. The writer, C. V. Hill, gathered in December over 1,000 eggs per day from 2,300 layers raised with the Magic brooders which net a clear profit of \$40 to \$50 per day. Come to Trenton and visit my Poultry Plant and see for yourself.

OUR GUARANTEE—Will refund money in 30 days if brooder does not do all we claim. Write for free catalog describing the Magic brooder together with plans of colony and laying houses. Live agents wanted in territory not taken. Address,

UNITED BROODER COMPANY
348 Pennington Ave. Trenton, N. J.

YOU are losing money if you raise poultry and do not use our MONEY- AND LABOR-SAVING APPLIANCES

Our catalog presents a gold mine of information on such subjects as—

Portable Runways, Henneries, Brood Coops, Colony Coops, Setting Coops, Fences, etc. Also Trapnests, Exhibition Coops, Fattening Crates, Fireless Brooders.

Our products are substantially made of galvanized iron, present an attractive appearance, are easily taken apart and packed for removal, and the prices at which we sell them make their purchase the most economical way of securing fixtures. Our Portable Henneries, with fence and other auxiliaries, present an attractive and fitting appearance in any yard. *Send Today for Catalog*

female in the variety today. All in all, we congratulate the breeders not only on the marked improvement in pullets over last year, but in the fine character of this class throughout.

Black Javas—Robie Whitney, Woodfords, Maine, 1 hen, 1 chl. Although a small entry at Boston, we understand from Mr. Whitney that there is a pronounced revival of interest in Black Javas in New England.

RHODE ISLAND REDS.

S. C. Rhode Island Reds—Harold Tompkins, Concord, Mass., 3-4-5 cock, 1 hen, 1-3 chl, 3 pl, 1-2-3 young pen, 1-2 old pen; J. A. Raddin, Cliftondale, Mass., 1 cock; Mirimichi Poultry Farm, 2 cock, 2-5 chl, 4 pl; Avon Red Feather Farm, Avon, Mass., 5 hen; Herman R. Sweet, Attleboro, Mass., 4 hen, 5 pl; E. F. Benson, Whitman, Mass., 3 hen, 4 chl, 1 pl, 5 young pen, 4 old pen; R. M. Ellis, Tipton, Mo., 2 hen; Frederick A. Waite, Concord Jct., Mass., 2 pl; Sunnyfields Farm, 4 young pen; William C. Stephens, East Livermore, Me., 3 old pen; M. B. Messer, Bedford, Mass., 5 old pen.

R. C. Rhode Island Reds—Payne Bros., Portland, Conn., 3 cock, 3 chl, 5 pl, 2 young pen, 1 old pen; A. C. Morehouse, Beverly, Mass., 2 cock, 5 hen; E. F. Benson, 4-5 cock, 5 chl, 1-2 pl; W. A. Chant & Son, Toronto, Can., 1 cock, 3 pl; H. W. Jones, South Braintree, Mass., 4 hen, 3 young pen; Avon Red Feather Farm, 3 hen; A. E. Alden, West Bridgewater, Mass., 2 hen; Holmhill Farm, Lee, Mass., 1 hen, 1-4 chl, 4 pl, 1-4 young pen; Phil M. Ferry, Hornell, N. Y., 2 chl; T. Edward Cordis, Longmeadow, Mass., 5 young pen.

W. H. Card judged the Single Combs and Harold Tompkins the Rose Combs. The shows are to lose both of these good judges. Mr. Card retires from judging after twenty-two years on the circuit. He finds the long trips are too much for his time and strength. He will probably continue to accept some engagements in New England. Mr. Tompkins finds that he cannot afford to leave his birds and his business to judge shows. The sale of one good bird puts more profit in his pocket and takes less time than the judging of the smallest show.

There was a big class of Reds at Boston. Single Combs, 25 cocks, 20 hens, 62 cockerels, 44 pullets, 21 pens, a total of 256 head, were entered. In Rose Combs there was a total of 110, divided thus: 24 cocks, 16 hens, 18 cockerels, 22 pullets, 10 pens. We spent more time examining the color of a male that was the winner of a relatively minor prize than on all the rest of the class put together. He was a comparatively small bird and had won his place largely on the strength of his deep, bright, astonishing color. We thought to ourselves that if such color can be put on Reds, and the practice of putting Reds in such condition becomes known and practiced among a dozen or so breeders, the rest of the Red fancy will be at an unbearable disadvantage.

There was the usual excitement in the Red alley. The talk of processed Reds was revived, and one cockerel was withdrawn from competition because his color was running. The breeder said to us that it was a surprise to him; that the bird had been grown by one of his farmer growers and that he had sponged him off with warm water and Gold Dust and that this had evidently started his color. The color of a Red is a funny thing. When processing first came up at Boston three years ago Dr. Conant stated that a strong alkaline soap would start the color on a Red. Those who freely admitted doing the processing stated that they had not used artificial color or dyed their birds. They stated that they had only brought out the color that was already in the bird.

Having been told at Boston that a commercial soap and hot water was all that was being used, immediately upon our return home we secured a bar of H. & H. soap, put one-sixth of the bar in a quart of boiling water and made a soap emulsion. We took a Red pullet and soaked her on one side, down to the skin, with this emulsion, and in twenty minutes we could rub red color off of her with a white handkerchief. The next morning she was dry and of a richer color on the surface and richer underneath on the side to which the emulsion had been applied hot. We understand that it takes ten days or two weeks for the color to set so it cannot be wiped off. We have not had time to test this.

Moreover, we do not know that it is H. & H. soap that is being used, but it did work out in the experiment. One thing is certain, what are said to be processed birds in the shows are rather sticky. No one but a fancier would recognize this stickiness in the feel of the feather, but after carefully

Mr. Poultryman:

Where are you going to buy your S. C. White Leghorn Chicks this year?

YOUR success in 1922 depends on your judgment at the present time. Every experienced poultryman knows there is only one kind of a chick he can afford to put in a brooder, and that is "A GOOD CHICK." Good chicks are hatched only from good eggs, and good eggs come from good hens. If you want "GOOD CHICKS" there has got to be good breeding stock back of the chicks.

Mr. Poultryman, did you ever stop to think that one winter egg alone pays the difference between the price of chicks bought from a dependable, first class plant and the cheapest chick you could buy—one of illegitimate parentage?

THE LORD FARMS

OF METHUEN, MASS., have been supplying the great bulk of their chicks for ten years to **EXPERIENCED POULTRYMEN**. That is the kind of business we have got. The kind you can't fool with gaudy advertising either in low prices or tremendous high record stock. We have never advertised to have the best Leghorns in the world nor the biggest layers in the world; but what we do advertise is—that we have got **SATISFIED CUSTOMERS**. We have got a strain of birds that lay on an average as good as any strain in the country, and it is only the good average that counts on a Poultry farm. If you trapnest your birds you will find for every 250 to 300 layer you have got another bird that wouldn't lay 75 so that in the long run it is simply a matter of good average.

Another thing we advertise is that our chicks live and grow into healthy, vigorous stock which is the foundation of all poultry success.

The only thing that counts in the Poultry business is the net profit you have at the end of the year. We would challenge any farm in America to show a better list of satisfied, prosperous customers than the Lord Farms can show. One-Man farms last year made profits from \$3,000 to \$7,000 on eggs alone. To get such profits means that these customers must have got a good average egg yield. They must also have been able to raise a great majority of their chicks. They must also have been able to market their eggs at good prices.

DON'T TRY TO SAVE A NICKEL AND LOSE A DOLLAR DOING IT.

You can't buy the very best goods either in automobiles, clothes, shoes or chickens and get the very lowest prices. On the other hand don't think that high prices always mean high class goods. There is a happy medium in all things. Here are our prices for probably the most dependable White Leghorn chicks you can buy in 1921.

		GRADE A.	
25-49	chicks	\$0.30
50-99	chicks29
100-499	chicks28
500-999	chicks27 1/2
1,000 or more	27
		GRADE B.	
25-49	chicks	\$0.27
50-99	chicks26
100-499	chicks25
500-999	chicks24 1/2
1,000 or more	24

SPECIALS.

These are our highest grade and sold only in limited numbers. No orders taken for less than 25 and no orders taken for more than 100 lots at a flat price of FIFTY CENTS PER CHICK.

EGGS FOR HATCHING.

Our price for eggs is just about one-half the price of the chicks.

The above prices are the most reasonable prices of any high classed farm in the Middle or Eastern States. Instead of raising our prices to make more money in our business we have adopted different methods. We produce more stock and more chicks every year. At the present time we are running four plants, two in Methuen, one in Andover and Tewksbury, and another in Bedford—all in Massachusetts. Last year we purchased another plant of 260 acres, and we own today 399 acres devoted to Single Combed White Leghorns only. The Lord Farms are real farms, not simply hatcheries. We are trying to standardize the business and get to the place where customers can depend year after year on good profitable stock. We have got good stock today—twice as good as we sold ten years ago, and we expect to have still better in the future. This year points to the greatest success we have ever had in the business. Our entire business is based on the confidence that the customer has in our stock.

This Sign

now means
what "BULIS"
formerly meant

It means that you get the same high-grade corrugated fibre-board boxes, and the same prompt, accurate service under the "Gaylord" organization that you formerly enjoyed under the name of "Bulis." Not a man has been replaced nor a machine changed. Identical materials are being used in the boxes. No changes are contemplated for the future, except such as the rapid growth of "Gaylord" sales demand. Well-filled warehouses containing boxes in stock sizes, and our location at the Terminal Yards in St. Louis, the commercial center of the country, make "Gaylord" the logical headquarters for corrugated boxes. Let "Gaylord" figure on your requirements for stock or special made-to-order boxes.

Bulis Egg-Boxes

While the firm name has changed, the name of our egg-boxes remains the same—Bulis Parcel Post Egg-Boxes. The tubular cartons and shipping boxes come to you knocked down flat and occupy little space. No glue nor tools are required to set them up. They go many times through the mail. Write "Gaylord" for prices.

WALHALLA POULTRY FARM :: OSCODA, MICH.

BUFF WYANDOTTE COCKERELS

Vigorous, clean buff color, Sanborn laying strain. Following for sale now at reasonable prices: 1st pen ckl. at Carrollton; 2d, 3d and 5th ckl., 2d pen ckl. and 2d cock at Missouri State Show. Also a nice lot from same matings, at \$5 and \$10 each. Can spare a few more pullets at \$5 each.

MRS. ELY BROYLES, Carrollton, Mo.

examining several of the birds that were shown at Boston, we are satisfied that they had not been washed in the sense that white chickens are washed.

The H. & H. soap solution does not affect the black of the bird. It does not put artificial color into the bird. It is a pure white soap. It is said to be used in hospitals for cleansing surgical instruments; is used for cleaning jewelry, oil paintings, painted walls, varnished woodwork, carpets, rugs, laces, draperies, silks, etc. However, its makers caution users to first test in clean, hot water the colors of the fabric to be washed, and they add that if hot water does not affect the colors, neither will H. & H. soap.

We would rather see the birds shown as they grow. We did not originate a way to bring out their color. But as a self-respecting commentator on the classes, we have been forced to find out, as far as possible, whether some of the Reds in the shows were growing with "burn your fingers" under color, or whether that color was being brought out in some other way.

This much should be said, however, that the value of processing has been overestimated, if our experiment is of any value. This soap emulsion will not turn slate to red; it will not make a white under color red; it will not remove black ticking; it will not take a light hackle and make it dark so that the neck will match the back. You have simply got to have a first class bird to work on. You cannot take one with a mealy breast and make it a rich, dark, level red. But where you have a good bird, the emulsion applied hot to the entire length of the feather will start the color and make a richer tone of color—one more full of life all the way down to the skin.

If there is any system by which an inferior bird can be made into a good one, we do not know what it is. Henna will not dye a Red because of the black parts. This pure white soap, however, does not harm the black parts.

We know that some will criticize us for saying the above. Others come to us in the showroom and pat us on the back and say that we are giving the public what is wanted. We are not here concerned with criticism or commendation. We are ready to say that it is all right to apply white soap and hot water, the same as cattleman do to bring out the color, provided all are informed how to do it and are on an equal footing. Equality in the showroom is the important thing.

S. C. Rhode Island Whites—Fred C. Huntress, 5 cock; Frank W. Cumpstone, New London, Conn., 1 cock, 1 hen, 2 ckl, 1 pl, 1 young pen; Massapoag Poultry Farm, Sharon, Mass., 2-3-4 cock, 3-4-5 hen, 2-4-5 pl, 2 young pen, 1 old pen; H. H. Metcalf, Hudson, Mass., 2 hen, 3-5 ckl, 3 pl; A. J. Cedergreen, Brockton, Mass., 1-4 ckl.

R. C. Rhode Island Whites—Fred C. Huntress, 4-5 cock, 5 ckl; N. H. Hartwell, Rockland, Mass., 1 cock, 4 ckl; A. J. Cedergreen, 2-3 cock, 2-5 hen, 3 ckl, 1-4 pen, 1 young pen; Massapoag Poultry Farm, 3-4 hen, 5 pl, 2 young pen, 2 old pen; Frank W. Cumpstone, 1 hen, 1 ckl, 2 pl, 1 old pen; R. G. McAndrew, Dorchester, Mass., 2 ckl, 3 pl.

Considerable interest in Rhode Island Whites. There is no question about the birds being good layers and splendid growers. Mr. Gough, of Rhode Island, who lived on the same place at Wakefield as Alonzo Jacoy, the originator of the breed, after Jacoy moved to Pennsylvania, and who has grown Rhode Island Whites for many years, commented on the 1st R. C. cockerel as the type of bird wanted. Said he: "I favor the Rose Comb variety. When you get the Single Combs where they belong, they will be similar to the White Plymouth Rock. The Rose Combs are or should be quite distinct from good White Wyandotte type." The entry at Boston consisted of 9 cocks, 8 hens, 11 cockerels, 10 pullets and 4 pens in Rose Combs. In Single Combs, 7 cocks, 6 hens, 9 cockerels, 6 pullets and 3 pens.

Buckeyes—A. H. Churchill, Brandon, Vt., 1-2 ckl, 1-2 pl, 1 young pen.

First Buckeye cockerel and 1st pullet a splendid pair. A wider distribution of such birds would be a splendid thing for the breed.

Jersey Black Giants—Meloney & Marcy, Matawan, N. J., 1-2-3 cock, 1-2-3 hen, 1-2-3 ckl, 1-2-3 pl, 1 young pen, 1 old pen; Fred C. Huntress, Randolph, Mass., 4-5 ckl, 2 young pen.

The winners were grand, big, meaty birds. Wonderful weight and strong bodies in cockerels. Legs on these young males that were solid. The birds look like thoroughbreds. If Black Orpington and Black Java men do not wake up, the Black Giants will come forward as the one popular American black

109 Chicks from 109 Eggs

**New Way of
Hatching Gives
Wonderful
Results**

MR. C. A. ASH, Litchfield, Mich., got 109 chicks from 109 eggs with a Porter SOFT-HEAT Incubator on her first trial. Roy Klavine, Geneseo, Ill., got 100 chicks from 100 eggs. "Better than hens," says A. Koons, So. Coffeyville, Okla., who got 240 sturdy chicks from 260 untested eggs. "Hatched every fertile egg," says C. F. Crease, State Line, Miss. "All hatched without invalids or cripples," writes G. R. Hollenbeck,

Rozell, Kan. It's no trick to make \$50 to \$150 a month with the dependable Porter Incubator.

Hundreds of users in every part of the country report hatches of 90 to 100% plump, perfect chicks with the SOFT-HEAT Tubeless, greatest improvement ever made. They succeed because Soft Heat is **moist** heat—life-giving, **natural** warmth—instead of the dead, dry, baking heat used in other hatchers. You, too, can decrease your losses and increase your profits—hatch more and stronger chicks and make more money with less effort by replacing hens and dead-heat incubators with

The Porter SOFT-HEAT Incubator

Warmth and Moisture

Moisture is **necessary** to life. U. S. Government says moist air in an incubator means bigger hatches and stronger, healthier chicks. The SOFT-HEAT **automatically** supplies the needed moisture by its patented air moistener—duplicates Nature's process exactly and hatches **every good egg**.

Hatches More and Stronger Chicks

Soft Heat does not dry out the eggs. They retain the elements needed for the chick's complete development. The result is sturdy, perfect chicks. And, instead of dead, dry air, laden with poisonous gases, they breathe and thrive in pure, **moist** air from the very first.

Tubeless, Gasless, Smokeless

No gas, smoke or bad odor ever is found in the Porter. Nothing but the purest of **moist** air ever reaches eggs or chicks through the SOFT-HEAT's **automatic** ventilating system. The PORTER'S patented full radiator plate eliminates cumbersome, unsatisfactory tubes and pipes.

Center Heat—Round Egg Chamber

Steady, **soft** heat, just like the hen's; radiated from **above**, just as the hen supplies it; in a round egg chamber, just like the hen's nest, makes the Porter Tubeless a true mechanical hen. Every egg is heated evenly every second—no matter how cold the weather.

No Suffocation—No Cripples

Dry-air incubation is a mild form of baking. It makes the shells hard, the inner membranes tough. Chicks can't pierce them. Suffocation results. The moist, soft heat of the Porter keeps shells brittle and inner membranes tender. Every chick that develops breaks through easily at the right time. Being strong and healthy, all chicks hatched the Porter way develop more rapidly, and make you more money. **The Porter hatches no cripples.**

Saves 300% One filling of the Porter's fuel tank—less than a gallon of oil—completes a hatch. Other incubators burn 4 to 5 gallons and the lamp must be filled daily. The SOFT-HEAT saves 300% in money, time and trouble.

Only Two Minutes' Care Daily

Eggs in the Porter can be turned in two minutes without removing or lifting tray. A child can operate the Porter. Hundreds of inexperienced users tell of getting 90 to 100 per cent hatches at their first trial.

All Controls Are Automatic

The control of moisture, heat and ventilation in the Porter is entirely automatic—safe and exact at all times, regardless of altitude or weather. The SOFT-HEAT requires less attention than any other incubator made.

Increase Your POULTRY PROFITS Turn every good egg into a plump, perfect chick that will grow quickly into money. Cut out the losses from crippling, suffocation and "scrubs". Produce **more** and **better** chicks with less labor and expense. You can do it with the SOFT-HEAT Incubator. Every Porter is backed by an Ironclad Guarantee.

No Experience Necessary Even if you never have used an incubator, you can succeed with the automatic Porter from the very first. Simplest incubator made. Our complete book of instructions makes it easy to get big hatches. No guess work—no trouble. **We Ship By PREPAID EXPRESS**

FREE! Read This Book Contains 64 pages, fully illustrated. Explains wonderful SOFT-HEAT System in detail. Shows you how to make poultry raising really profitable. Gives letters from SOFT-HEAT users, telling of amazing success. Be progressive! Investigate the new way—the **natural** way of incubation! Send name TODAY—a post card will do—for FREE copy of this big book.

PORTER INCUBATOR CO., 806 Porter Bldg., Blair, Nebr.

SAFETY HATCH INCUBATOR THERMOS BOTTLE PRINCIPLE

This Means
Double
Results

4-ply walls, nearly 2 inches thick, with wool-felt strips and vacuum air spaces between, doubly protect eggs in the SAFETY HATCH—and this often means double results! Heat, moisture, ventilation positively maintained at hatching temperature; Thermos bottle principle. Many other exclusive features, making for safety, sanitation and certainty. Insures a healthy chick from EVERY fertile egg of normal vitality if simple directions are followed.

SOON PAYS FOR ITSELF

Not an expense—but a big money-making investment that soon pays for itself and then pays a large quick profit. With abundant feed crops at reasonable prices, and a big demand for poultry and eggs at HIGH prices, there's good money to be made raising poultry the SAFETY HATCH way.

WRITE FOR FREE BOOK

The SAFETY HATCH BOOK is the most interesting incubator book you ever read—a liberal education in chick hatching and care. Sent FREE postpaid, to those who write us promptly. Drop us a postal—TO DAY. Get all the facts.

fowl. There is considerable interest in the breed. It does not carry the excessive fluff of the Orpington or the elongated type of the Java, and is a well built fowl with excellent substance of body. The utility of these birds is unquestioned, as the breed has been a favorite for thirty years with Burlington county (N. J.) farmers for making Philadelphia capons.

ENGLISH CLASSES.

A Dark Dorking hen, well worthy of a place in any showroom; a pair of Red Dorkings—thus was the finest table poultry breed of the old world represented. Going, going, gone? No, we believe not. Some of the breeds seem to slumber for a time and then awaken. Some day someone will be attracted to the Dorking, and spend a small fortune gathering together the best available specimens.

S. C. Buff Orpington—Egg-A-Day Farm, Meriden, Conn., 4 cock, 5 chl, 4 pl, 1 young pen, 1 old pen. Kingman & Nickerson, Randolph, Mass., 3 cock, 3 hen, 2 old pen. Geo. E. Bessom, Mansfield, Mass., 5 cock, 2-3 chl, 2-3-5 pl; Nickerson & Kingman, Harwichport, Mass., 1-2 cock, 4 hen, 1 chl; Chas. W. MacNear & Son, Ashland, Mass., 2-5 hen, 4 chl; Joshua Shute, Meriden, Conn., 1 hen, 1 pl.

Eight cocks, 13 hens, 21 cockerels, 15 pullets, 3 pens. As last year, 2d cock was the superior bird. A really good Buff Orpington cock; big, level colored bird, good head, finished tail that matches rest of body. First cock, not as good type as 2d, tail not finished, a shade richer in color.

First hen, a female of good substance and practical type. First, 2d, 3d hens, nice big females, good surface and type; three best hens seen in Boston in several years.

First cockerel, an outstanding bird in this class; level sheet of golden color; good type; Orpington head. Second cockerel, a rangier bird.

First pullet, a practical type, but hardly wide enough across cushion; good color and clean tail; some brown in shanks; well balanced on legs, pitching forward with good breast.

S. C. Black Orpington—John T. Ratcliffe, North Andover, Mass., 1 cock, 4-5 hen; M. W. Brown, Wakefield, Mass., 3 cock, 1 hen, 3 chl, 2-3 pl; Frank Lynch, Westerly, R. I., 2 cock, 2 hen; Thos. J. Hinks, Whitman, Mass., 3 hen; Joel L. Parks, Wilmington, Mass., 4 chl, 5 pl; A. A. Gathemann, Hanover, Mass., 1-2 chl, 1-4 pl.

Three cocks, 7 hens, 4 cockerels, 6 pullets. First cock, rather small, cut away in breast; more perpendicular than horizontal carriage of wings. First hen, a good Black Orpington. In Black hens, the biggest feather bag went down to 5th. A few seasons back she would have stood a good chance for 1st. This is in line of progress. Neither 1st or 2d cockerels were large, and carried too much feather for their bone and weight. First pullet, fairly clean lines and worthy of place. Second pullet, pronounced fluff.

Blue Orpingtons—W. F. Worcester, 1 cock, 1 hen; Manetto Hill Farm, Hicksville, N. Y., 1 chl, 1 pl.

The outstanding birds in Blues were 1st cock and 1st hen.

S. C. White Orpingtons—T. B. Farnam, Lanesboro, Mass., 2 cock; John R. Johnson, So. Windham, Mass., 3 cock, 4-5 hen, 2-3 chl, 1-4 pl, 1 young pen, 2 old pen; Sunnyfields Farm, 4 cock, 3 hen, 4 chl, 1 old pen; H. H. Seaver, Templeton, Mass., 1 cock, 5 chl, 3 pl; Mary M. Hitchcock, Ware, Mass., 1-2 hen, 1 chl, 2 pl; Ben Milward, Everett, Mass., 5 pl.

The entry of White Orpingtons consisted of 6 cocks, 15 hens, 13 cockerels, 16 pullets, 3 pens. First cock, a well finished bird, big, not as broad over back as we like. A real good cock disqualified for a stub. First hen, a nice female, smooth texture of feather, shown to good advantage. Second hen, shorter in back, pinched in tail, but worthy of her place. Not a strong class of cockerels. Fourth cockerel young, but bird of promise. Mixed quality in pullets. First had bumble foot. Second pullet, white and well put down. Fourth pullet, looser feathered.

Dark Cornish—Ernest B. Stanley, No. Bennington, Vt., 1-2-3 cock, 1-2-3 hen, 2-5 chl, 5 pl, 2 young pen, 1 old pen; J. N. Hazlett, 5 cock; John M. Priske, Hudson, N. H., 4 cock, 4 hen, 2 pl; Dr. H. H. Reid, Barre, Vt., 5 hen; Buttrick Bros., Fitchburg, Mass., 1-3 chl, 1-4 pl, 1 young pen; W. A. Reed, Nashua, N. H., 4 chl, 3 pl; A. J. Densmore, Lebanon, N. H., 3 young pen.

A good class of Dark Cornish. Seven cocks, 9 hens, 10 cockerels, 11 pullets, 4 pens. First cock, typical, but smaller than winners at club show at Chicago. Second

Brood
Your
Chicks

30 Days
FREE

Simplex
Brooder
Stove

Use the new 1921 Simplex Brooder

Stove on your own hatch for thirty days free. Raise 20 to 50 per cent more chicks at 1-5 the cost, 1-10 the work and 1-4 the operating expense. Small and large broods. Three sizes of stoves. Try our stove under all conditions and if you are not delighted send it back and we will cheerfully refund your money.

Turn Losses Into Profits

This wonderful brooder will raise 50 per cent more of your chicks than you have been able to raise under the old fashion methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by the extra money it makes for you. The Simplex Brooder Stove burns kerosene oil, natural or manufactured gas, automatically regulated to insure an even temperature with the least possible attention.

Free Brooder Book

Write today for valuable free brooder book and catalog. It tells how to increase your profits by decreasing mortality. Tells how to save chicks you have been losing each year through disease and faulty brooding. How to make more money. Also catalog and details of 30 days trial free. No obligations. Write now.

YOUNG TYPEWRITER CO., Dept. 65, Chicago

cock, too much tail. First hen, a good one, but 2d Chicago hen overpowers her in size and proportions. The cockerels showed good type throughout, but again small compared to what the club meet brought out. First pullet, worthy of special mention; splendid Cornish pullet in type and ground color; some single lacing in back.

White Cornish—F. H. Howland, Worcester, Mass., 1 cock, 1-2-3 hen, 1-5 ckl, 1-2-3 pl; L. J. Smith, Deep River, Conn., 2 ckl; F. Brown, Marblehead, Mass., 3-4 ckl, 4-5 pl. About the usual run of White Cornish. One cock, 4 hens, 6 cockerels, 5 pullets, 1 pen. The best quality was recognized by the judge, F. C. Burbank.

White Laced Red Cornish—Wm. R. Emslie, Barre, Vt., 2 cock, 4-5 ckl; W. H. Card, Manchester, Conn., 1-3 cock, 1-2-3-4 hen, 1-2-3 ckl, 1-2-3-4-5 pl; Wm. R. Wells, Ashaway, R. I., 4 cock, 5 hen.

Four cocks, 7 hens, 5 cockerels, 5 pullets. First cock a wonder: laced breast and wing bar, darv red wing bow and back; rich red neck evenly tipped with white; nicely tipped saddle; white tail. Such color is again shown in 1st and 4th hens. Second hen wins on type. First cockerel carries earmarks of 1st cock which was four years old and had been bred back three times, first to his pullets, then granddaughters, and then to his great granddaughters. Second cockerel, not worthy, having fan tail, white thighs and miserable comb. First pullet, worthy of her place. Second pullet needs more skull.

Speckled Sussex—B. O. Schilling, Rochester, N. Y., 1-2 cock, 1-2 hen, 2-4 ckl, 1-2 pl; Chas. Gerlach, Allentown, Pa., 3 hen, 3 ckl; Geo. A. Mole, Lenox, Mass., 5 ckl, 3-5 pl; Glidden Forbes, Cambridge, Mass., 1 ckl, 4 pl.

Two cocks, 3 hens, 6 cockerels, 5 pullets. Some of Mr. Schilling's birds fought in their coops en route to Boston and appeared rather bloody, but their superior quality won for them. The females of this line were particularly good: rich in ground color; nicely barred with black; cleanly tipped with white. Good hackles.

MEDITERRANEANS.

Dark S. C. Brown Leghorns—Albert G. Tilton, Fulton, N. Y., 5 cock; Harry W. Weeks, Framingham Center, Mass., 4 cock, 5 ckl; H. V. Tormohlen, Portland, Ind., 3 cock, 2-3 ckl; Grove Hill Poultry Farm, Waltham, Mass., 1-2 cock, 1-4 ckl; J. A. Raddin, 1 hen, 1 pl.

Light S. C. Brown Leghorns—Albert G. Tilden, 2 hen, J. A. Raddin, 3 hen; Harry W. Weeks, 1 hen, 4 pl; H. V. Tormohlen, 4-5 hen, 1-2-3 pl.

In Dark S. C. Browns, 7 cocks, 1 hen, 12 cockerels, 1 pullet, 1 pen. In Light Single Comb Browns, 6 hens, 4 pullets, no males. First and 2d S. C. Dark cocks had great color; 2d, not as good in comb; 1st, fails at juncture of back and tail. Third cock, good type, showing no cotton at base of tail.

As we looked at 1st S. C. dark cockerel, we said to ourselves: "There is no use talking. Bright has wonderful saddles on his birds." Some liked his unplaced cockerel, No. 1337, best. Second cockerel had elegant back and wonderful tail. First was a better stationed bird than 2d.

S. C. Light Brown females, both hens and pullets were attractive. First hen and 1st pullet, good ones. Mr. Bright was taken down with diphtheria upon his return from the Chicago Show.

Dark R. C. Brown Leghorn—Wm. Ranger, Olneyville, R. I., 1 cock; Eben F. Gay, Norwood, Mass., 2 hen; Percy Johnson, Lakewood, R. I., 1 hen, 1 ckl, 1 pl; John L. Woodbury, Cornish, Me., 3 ckl; Fred C. Mather, Brunswick, Me., 2 ckl; Rust & Schulz, Jamaica Plain, Mass., 2 pl.

Light R. C. Brown Leghorns—D. C. Lake, Oneonta, N. Y., 1 cock, 2-3 hen, 1 ckl, 2-3 pl; Percy Johnson, 1 hen, 2 ckl, 1 pl; Fred Of Dark Rose Comb Browns, 1 cock, 2 hens, 3 cockerels, 2 pullets. Of the Light Rose Combs, 1 cock, 4 hens, 3 cockerels, 3 pullets. C. Mather, 3 ckl.

In Rose Combs, the Light Browns were the tops of the class.

S. C. White Leghorns—Wm. Whiting, of Holyoke, Mass., 5 cock, 1-2 hen, 4-5 ckl, 5 pl, 1 young pen; E. H. Bartlett, Enfield, Mass., 4 cock, 4 hen; Geo. A. Davidson, West Millbury, Mass., 2 cock; Chas. H. Wheelock, Weston, Mass., 3 cock; Foster Bros., Pawtucket, R. I., 1 cock, 3 hen, 2 ckl, 2-3 pl; John F. Chaponi, Kensington, Conn., 5 hen; John McDougall, Pawtucket, R. I., 1st ckl, 1 pl; H. S. Rich, Springfield, Mass., 3 ckl; Wm. Grindrod, Pawtucket, R. I., 4 pl; E. C. Robinson, Randolph, Mass., 2 young pen.

R. C. White Leghorns—J. M. Chase, Wall-

(Continued on page 204.)

Dr. LeGear says

"To get more winter eggs hens must have help."

You must counteract conditions that hens live under in winter by stimulating their egg producing organs and fortifying their systems against disease. Thus you will increase your profits. Dr. LeGear's Poultry Prescription will do these very things. Used successfully by thousands of poultry raisers." For example:

"From my small flock I now get 20 to 25 eggs a day. Before giving them Dr. LeGear's Poultry Prescription I got only 4 or 5. Its cost has been repaid to me over and over." Mrs. J. W. Montgomery, Tunnel Hill, Ga.

The Mark of Quality

Eggs

A good chick will never hatch out of a poor egg. Every egg we sell is laid the day of shipment.

We do not sell eggs as gathered, but separate them so that only the large eggs of perfect shape and of perfect construction are received by the purchaser. Every egg is examined with a tester; those showing thin or porous shells are thrown out for market purposes.

Good Stock Underlies Success

The stock with which you start is not to be remembered as but a beginning. The blood of your foundation stock will run thru each new generation of poultry you grow. The laws of heredity and transmission are permanent—each new crop of chicks will bear the likeness of their parents and ancestors. The opportunity to purchase a better stock is yours—

OAK DALE SINGLE COMB WHITE LEGHORNS

When you buy from us, you procure for yourself the selective breeding of generations, during which time the pedigree of the line has been restricted to choice individuals.

The only necessary preliminary to the desired end is pure bred stock with which to start, for the superstructure cannot be erected before the foundation is laid.

An Oak Dale bird will produce its own kind, and, therefore, reliability exists in its breeding.

OAK DALE FARMS, Box A, AUSTIN, MINN.

Once a Customer—Always a Customer

New Stock To Live and Grow

To hatch eggs and get chicks that live and grow, the stock that produced the eggs must be strong, carefully selected for vigor and constitutional strength and well mated.

We do not try to see how many eggs we can get; instead we try to keep the hens vigorous and in good breeding condition so that they can lay eggs that will produce worth-while chicks.

OAK DALE **SINGLE COMB WHITE** **LEGHORN**

cannot enter the breeding pens until they come up to a standard of health and vitality set by us—thus assuring you that the progeny cannot be affected by any weakness of the breeding stocks.

Strict culling is maintained all thru the breeding season and any bird that does not appear robust is discarded.

No matter what your wants may be, we are prepared to fill them in a satisfactory manner. Show Birds, Breeders, Hatching Eggs and Baby Chicks all bred from stock that has won the majority of prizes at Madison Square Garden for the past twenty years.

The Mark of Quality

Chicks

A chick well hatched is half raised. Oak Dale brings chicks into the world possessing a great amount of vitality and that can even be reared successfully under adverse conditions.

These chicks grow and thrive and develop into large, healthy, profit-producing specimens. We suggest that you place your order today for some of these chicks and avoid disappointment of ordering too late.

GRANDVIEW WYANDOTTE YARDS

SPECIALTY BREEDERS OF

COCKS HENS WHITE WYANDOTTES COCKERELS PULLETS

EARL GOSSETT, Box A. WINNERS AT OHIO'S BEST EXHIBITIONS BANNOCK, O.

kill, N. Y., 1 cock; H. O. Matthews, Concord, N. H., 1 ckl, 1 pl.

There were 6 cocks, 6 hens, 13 cockerels, 15 pullets, and 2 pens in Single Comb White Leghorns. First cock had a narrow back, short, pinched tail, poor front. Second cock fails in comb but a bird of some quality. Third cock, a little runt. Second hen, an outstanding bird of excellent quality. First, a good hen.

Boston is seldom strong in White Leghorns, and the class of cockerels this year was mediocre. First cockerel, short bodied bird, well spread but poorly finished in tail; blistered ear lobes; some cotton at base of tail. Second cockerel, a bird that would please the majority of breeders; main tail feathers rather pinched, probably due to the washing. Third cockerel, heavy and coarse in comb.

First pullet a rather large bird and loose in feather. Fifth, a fine pullet in all respects. Second pullet on order of 5th.

S. C. Buff Leghorns—Homer N. Simpson, Suffern, N. Y., 2-4 cock, 3-5 hen, 2-3-4 ckl, 1-3 pl, 2 old pen; Richard Vanderheid, Hawthorne, N. J., 1 cock, 1-4 hen, 2-4 pl; Walter V. Olney, Naples, N. Y., 3 cock, 5 pl, 2 young pen; C. H. Wheelock, 5 cock, 1 old pen; C. V. Norris, Thorntown, Ind., 2 hen, 3 young pen; Ernest Poit, Torrington, Conn., 5 ckl; Mrs. A. P. Wilcox, Heath, 1 ckl; Greenford Poultry Yards, Silver Creek, N. Y., 1 young pen.

R. C. Buff Leghorns—E. W. Terwilliger, Utica, N. Y., 1 cock, 1-2 ckl, 1-2 pl.

Seven cocks, 12 hens, 17 cockerels, 15 pullets, and 5 pens in S. C. Buff Leghorns. First cock, best in adult male class, big, good color, lacks graceful style of a Leghorn. Second cock, decidedly deficient in size and shape. First hen, most comb in the class. Third, a good Buff Leghorn hen. First cockerel, a pleasing bird. Second cockerel, too short in thigh. A rather nice class of pullets, but nothing sensational.

S. C. Black Leghorns—Waldo R. Bryant, Brockton, Mass., 2 cock, 2 hen, 1 pl; Mrs. T. W. Spencer, Canton, Mass., 5 hen, 4 ckl, 1 old pen; Jas. Baron, Swansea, Mass., 1-3-4 hen, 2-5 ckl, 2-3 pl, 1 young pen; Stephen O. Packard, 3 ckl, 5 pl; John A. Davis, Campbell, Mass., 4 pl.

Three cocks, 10 hens, 13 cockerels, 9 pullets, 3 pens. First and 2d hens, two good ones. Cockerels were young. First pullet, stiff upright comb; a few white feathers on head.

S. C. Black Minorcas—E. M. Zimmerman, So. Manchester, Conn., 1 cock, 4-5 ckl; John MacKenzie, Mass., 2 cock, 1-2 hen, 3 ckl, 3-4 pl; Wm. Grindrod, 3 cock, 3 hen; Chas. H. Hodgate, Fall River, Mass., 1 ckl, 1-2 pl; French & Sawyer, Peabody, Mass., 2 ckl; Rockdale Minorca Farm, Peabody, Mass., 5 pl; F. E. Paige, Medina, N. Y., 1 old, 1 young pen.

R. C. Black Minorcas—Mrs. E. A. Washburn, Taunton, Mass., 1-3 hen, 1-2 ckl, 1-2 pl; Paul S. Jones, Brockton, Mass., 2-4-5 hen; Mrs. J. Allen, Allerton, Mass., 3 ckl.

In Single Comb Black Minorcas, 4 cocks, 5 hens, 8 cockerels, 8 pullets, 2 pens. First cock, a big, long bird, with good carriage and good head. Second cock big, fails in comb. Third, lacks thigh, tail not finished. Cock No. 1515, shown by F. E. Paige, Medina, N. Y., arrived after this class was judged; a good cock and would have hustled the winner for 1st place. Hens were not equal to the males. First cockerel, a good one. Second, a larger bird and also good. A nice class of pullets.

Quite a showing of Rose Comb Blacks; females still a little too much on order of Ham-burg carriage and style.

S. S. White Minorca—Hamilton Egg Farm, Rochelle Park, N. J., 1 cock, 1-2 hen, 1 ckl, 1 old pen.

First and 2d hens, good, big, long bodied matrons.

S. C. Buff Minorcas—Arthur L. Evans, of Wakefield, Mass., 1-2 cock, 2-3-4 hen, 1-2 ckl, 1 old pen; P. J. Van Dael, Malden, Mass., 1 hen, 1 pl. First cockerel a good one and top of class; a little more size would improve him.

R. C. Buff Minorcas—P. J. Van Dael, 2-3 cock, 2 hen, 2-3 ckl, 3-4 pl; J. A. Conway, Malden, Mass., 1-4-5 cock, 1-3-4-5 hen, 1-4-5 ckl, 1-2-5 pl.

First cock would have won about as well in a Rose Comb Buff Orpington class. Same can be said of 1st hen.

Blue Andalusians—E. D. Bird, Greenwich, Conn., 2 cock, 2 hen, 4 pl, 1 old pen; J. E. Bliss, Clinton, Conn., 1 cock, 1 pl; Harry T. Cotting, Rhinebeck, N. Y., 3-5 cock, 3 hen, 3 ckl, 2 pl, 3 old pen; John McCourtie, Winchester, Can., 4 cock, 4-5 hen, 2 old pen; N. M. Murray, Campbellview, Can., 1 hen,

**“Bigger Hatches
of Best Chicks”**

**“Chicks Grown
with Least
Trouble and
Expense”**

That's the record of

PRAIRIE STATE

INCUBATORS AND BROODERS

AND that record should influence every thoughtful buyer of chick-producing equipment. Past performance is the real test of value—not unsupported claims or glowing promises. Any manufacturer can make the latter.

PRAIRIE STATE Incubators and Brooders have been the standard equipment of America's leading poultry producers for nearly forty years. They have played a mighty big part in the development of the industry to its present huge proportions. They have for years, and are today, endorsed by the greatest authorities in poultry husbandry—by money-making commercial poultrymen—by the leading fanciers—by agricultural college teachers and experiment station investigators.

Admittedly the favorite equipment of poultry experts, PRAIRIE STATE Incubators and Brooders are even more necessary to the amateur who lacks the knowledge and experience of the expert. Necessary because the machines are so perfectly designed and so carefully constructed that they *automatically*—and under the widest range of local con-

ditions—provide exactly the conditions required to turn fertile eggs into husky chicks—to grow the chicks to early maturity. They eliminate uncertainty, guess-work and risk—they insure success. That's their *record*—established and maintained by nearly forty years of satisfactory service.

You can buy *lower-priced equipment*—you cannot buy *cheaper equipment* when you consider *number and quality* of chicks *hatched and raised*. And with poultry products at the present high level you cannot afford to buy or use anything but the most efficient hatching and brooding machines. Select the PRAIRIE STATE and have no regrets.

You owe it to yourself and to your business to carefully investigate. So write now—*today*—for the complete PRAIRIE STATE catalog. Learn about the exclusive features—the perfection of design—the superior materials and workmanship—the unusual PRAIRIE STATE GUARANTEE, which is the broadest ever written. The book is mailed FREE. Where shall we send your copy?

PRAIRIE STATE Incubators and Brooders are sold by progressive dealers generally. Ask your dealer—if he won't supply you, we will.

BUFF ORPINGTONS

from

MAYSLAKE FARMS

are one of the leading and oldest winning strains in America

At Chicago Coliseum Show, 1921

They won 1 and 4 Cocks, 1 Hen, 4 Cockerel, 1 and 2 Pullets, 2 Old and 2 Young Pens—as many First and Second ribbons as all competitors combined.

Grand lot of Cockerels at \$10 and \$15 each. Eggs, \$10 per 15 from all matings, or \$15 per 15 from pens of your selection.

Mayslake Farms, Hinsdale, Illinois

F. S. PEABODY, Owner FRANK F. CONWAY, Manager Poultry Dept.

FIRST PRIZE BUFF ORPINGTON COCK
CHICAGO COLISEUM SHOW DEC. 1921 EXHIBITED BY
MAYSLAKE FARMS HINSDALE, ILL.

"VIKING" RHODE ISLAND WHITES

Are the GREATEST OF ALL LAYING CHICKENS

At our biggest national laying contests the Rhode Island Whites are making more wonderful official laying records than have ever been made by any other variety of poultry. At the last great American Laying Contest the R. I. Whites averaged 243 eggs per hen for the year, the White Leghorns averaged 190 eggs, and the Anconas 117 eggs. The R. I. Whites averaged more than twice as many eggs per female as the Anconas. And they are also splendid market fowl, easily confined, easily raised, and beautiful.

A Boom Is Coming for This Grand Breed

Every thoughtful breeder of poultry should investigate now and get ready for the boom. "Once a breeder of 'Viking' R. I. Whites, always a breeder." Write today for convincing proofs and further information.

Arnold's S. C. Buff Leghorns

Never before have we put together four such grand matings as we have for the season of 1921. We got ten years ahead the past season. Small combs, low tails and even golden buff in our males are outstanding features, and results must be most gratifying. Eggs from these four pens only \$10 per 15; ten chicks to a setting guaranteed. All eggs sent prepaid, by parcel post. No baby chicks. A few fine cockerels for sale.

AUG. D. ARNOLD

Box 777

DILLSBURG, PA.

1-2 ckl, 3 pl; Roy E. Barnard, Westfield, Mass., 4-5 ckl, 5 pl.

A strong entry of Blue Andalusians. Six cocks, 12 hens, 16 cockerels, 15 pullets, 3 pens. The males were upstanding birds with good substance to body. First hen, a big Blue Andalusian, good lacing and blue ground color. The 1st cockerel was the outstanding bird in the class. Pullets were well grown, nice long bodies, but none were as intensely laced as we like.

Black Spanish—Geo. B. Evans, Waban, Mass., 1 cock, 1-2 hen, 1-2 ckl, 2 pl; E. S. Harris, Dorchester, Mass., 2 cock, 3 hen, 3 ckl, 1 pl.

Red showed in plumage of both 1st and 2d cocks. First hen won shape and color specials and was worthy of them. First cockerel won shape and color; a very fine cockerel; not as rangy as a Minorca either in reach of legs or length of back; a distinctive type; pure white face of soft texture, not too long in development.

S. C. Anconas—Mrs. M. E. Crahan, Revere, Mass., 3 cock, 1-4 hen, 3 ckl; R. B. Rich, Worcester, Mass., 1 cock, 2-5 hen, 4-5 ckl, 4 pl, 1 young pen; Lamberts Poultry Farm, 2 cock, 5 pl; Dr. N. A. DeWitt, of Stoneham, Mass., 4 cock, 3 hen, 1 pl, 2 young pen; Royal Poultry Yards, Schenectady, N. Y., 1 ckl, 4 young pen; M. N. Gage & Son, Silver Creek, N. Y., 2 ckl; Geo. F. Williams, Waban, Mass., 2-3 pl; Mrs. T. W. Spencer, Canton, Mass., 3 young pen.

Five cocks, 2 hens, 16 cockerels, 18 pullets, 4 pens. First cock looked young for cock class. Second cock, not big but splendid head and nicely ticked in hackle, wing bow and saddle. Such ticking is unusual and is well worthy of recognition even though, as in this case, flights were medium light. Sound tail on 2d cock. First cockerel, good head, dark color, considerable style, not big. In the hen class the judge jumped from a light color which he placed 1st to a hen with dark colored plumage for 2d. Pullet class comprised birds of the best quality in the way of females. First pullet a little more spirit, less length of back, slightly lighter tail and less abdomen than an ideal Ancona. Pullet in coop No. 1680, unplaced, and the best pullet in the class; true Ancona type, elegant green sheen and clear white, neat tipping.

R. C. Anconas—Leo M. French, Framingham, Mass., 1-2-3 cock, 1-3-4 hen, 1-2-5 ckl, 2-4 pl, 1-2 young pen; Chas. H. Curtis, W. Medway, Mass., 5 cock; John R. Rogerson, W. Medway, Mass., 4 cock, 4 ckl; Hillcrest Ancona Yards, Winthrop, Mass., 2 hen, 3 pl; C. E. Jones, Keene, N. H., 5 hen, 3 ckl; W. H. McNaughton, Newton Hlds., Mass., 1 pl; Chas. D. Chapman, Hoosick Falls, N. Y., 5 pl.

Six cocks, 5 hens, 10 cockerels, 15 pullets, 2 pens. Quality not as attractive as that seen in the Single Comb Anconas.

FRENCH AND CONTINENTAL

Mottled Houdans—Wildwood Farms, Sayville, N. Y., 1-2 cock, 1-2 hen, 1-2 ckl, 1-2 pl, 1 young pen; C. M. Belliveau, Allerton, Mass., 2 young pen.

First cock, 1st hen and 1st pullet, good Houdans, having size, length and fullness of bodies and sound color.

Salmon Faverolle—Jas. Burke, of Dedham, Mass., 2 cock; L. E. Tyler, Brockton, Mass., 1 cock, 1 hen.

First cock, big; good top color; sound black breast. First hen, good size and type; best head and muffing ever seen in the breed.

White Faverolle—L. E. Tyler, Brockton, Mass., 1 ckl, 1 pl. A nice pair.

Lakenvelder—Wildwood Farms, 1-2 cock, 1-2 hen, 2-3 ckl, 1-2 pl, 1 young pen; Burleigh A. Jones, 1 ckl.

Very good quality among the winners. Breeders are getting sound black hackles and heads, the latter a difficult point to perfect. A breeder at Boston had a number of color plates from Germany, and from these pictures in colors, it was plain that the German breeders are producing a much whiter back and saddle in their males. Such males should breed good females, but it must be difficult to get sound black heads and necks in the cockerels.

Buttercups—Chas. J. Lieber, Homer, N. Y., 5 cock, 1 hen; Chantecler Poultry Plant, Ulster, Pa., 3-4 cock, 2 hen, 3-4 ckl, 5 pl, 5 young pen, 2 old pen; C. Sidney Cook, W. Newton, Mass., 2 cock, 3-4 hen, 1-2-4 pl, 1 young pen; Dr. Rufus J. Howe, Worcester, Mass., 1 cock, 3 pl, 4 young pen, 3 old pen; R. J. LaLone, Potsdam, N. Y., 5 hen, 1-2 ckl, 2 young pen, 1 old pen; H. E. Waldron, Torrington, Conn., 5 ckl; F. J. Darby, 3 young pen.

A strong showing of Buttercups. Fifteen cocks, 16 hens, 19 cockerels, 35 pullets, 11 pens. It was noticeable throughout the class

Free Book Tells How

that breeders are producing a more consistent color in males. The markings on the females are likewise the most consistent that have been shown. It seems as if every Buttercup exhibitor goes to the show with his birds and the enthusiasm of these men sometimes takes too aggressive a turn, especially during judging. Errors on the part of the judge are therefore to some extent pardonable.

Winning males are coming nearer to one shade of color, type is being established, and penciled fluff is being recognized. The judge did not lay over emphasis on comb. First cockerel level, rich color, pretty much of one shade, fine black tail, no black in breast, smooth green shanks, splendid type; one point in center of cup comb. Buttercup men are often too severe on a technical feature such as a point in center of cup. Type, color and markings can best be advanced by not riding a hobby on any mere detail. Color of lobes in males needs improvement for that is a fundamental.

First hen had stubs, both present and past; but she was a study in correct color.

Silver Campine—Homestead Campine Farms, Wayland, Mass., 1-2 cock, 1-2 hen, 1-2 chl, 1-2 pl, 1 young pen; E. E. Hopkins, Woburn, Mass., 2 poung pen.

Five years ago, at the Palace, New York Show of December, 1915, the Homestead Campine Farm showed a Silver Campine cockerel that was the conceded winner before the ribbons were hung. He had a beautiful hackle, sound breast barring, long saddle feathers that were rich in green sheen and they were distinctly crossed with clean cut white bars. That bird was also good in tail, was of good size and splendid conformation. This year at Boston, this farm showed a pullet that was equally outstanding—an advance in the breed. She had a good head, neat comb, dark eye, good hackle, well barred breast, long back, proper carriage of tail, and her barring was so straight that there was a continuity of barring that formed ringlets over her back and tail coverts. Her dark bar was free from a rusty secondary bar, and her white bar was clear and clean cut. She was equally as remarkable, equally as positive a step in advance, as old Palace Boy. She won 1st.

Her sire was the 2d cock. The 1st cock was a grandson of Palace Boy; he had a neat, nicely serrated comb, black eye, quite a clean white lobe, good hackle and breast, two points that are hard to get in one bird; elegant carriage of tail; remarkably well barred sickles and tail coverts; long saddle, deep in green sheen that contrasted with the clear white bars.

The two hens were good—better than the pullets used to be—and the winning pullet, as already described, was superior to any Silver Penciled Hamburg female in the show, and much richer and stronger in color as is natural for a Campine to be.

As we looked over some of the junk that the low entry fee and generous classification at Boston brought out, we wondered why it was that beginners should go into some of the partly made breeds, when blood of such wonderful birds as were cooped in the Campine class was available at reasonable prices. No breed in Boston showed better quality, as judged by the Standard for each respective breed, than the 1st cock, 1st hen, 1st cockerel and 1st pullet in Silver Campines.

The novices make breeds popular; they are the people who take up breeding and the choice they make determines the status of breeds as far as general popularity is concerned.

We have tried to tell the facts in this show report about a number of the different breeds as seen in a great representative show, and if we have been a little rough in some of our comments, perhaps the reader will pardon our words knowing that our motive is to guide and not lead the amateur astray. If our extensive and rather long opportunity for observation is accepted as of some value, our effort to fittingly emphasize the true quality of the really established breeds in which splendid specimens are being produced, will not be in vain.

Black Hamburg—John Lowell, Chestnut Hill, Mass., 1-4 cock, 2-3 hen, 1 chl, 4 pl; E. P. Saltonstall, Chestnut Hill, Mass., 3 cock, 4 hen, 3 chl, 1 pl; S. H. Fessenden, Chestnut Hill, Mass., 5 cock; J. L. Little, Boston, Mass., 2 cock, 5 chl, 5 pl; Lyman & Storer, Waltham, Mass., 5 hen, 2 pl; E. A. Kuhlen, Everett, Mass., 1 hen; Mrs. Ralph Lowell, Dedham, Mass., 2-4 chl, 3 pl.

Golden Spangled Hamburgs—John Lowell, 1-2-3 cock, 1-2-3-4-5 hen, 1 chl, 1 pl.

Silver Spangled Hamburgs—John Lowell, 4-5 cock, 2-4-5 hen, 3 pl; Dr. J. S. Wolfe, Bloomfield, N. J., 1-2 cock, 1-3 hen, 1-2-3

The Buffalo Incubator

Is Not Cheap

but it is

40% Lower in Price
than any other hatcher that can
claim standard construction

The Buffalo is made RIGHT—and priced as low as it is possible to sell at the present market. Sizes—60, 120, 240, 360 eggs.

My three incubators are all of world-wide fame; but none has so many friends among the practical poultrymen as the Buffalo—because it is the BEST and the CHEAPEST. Having tried all the hatchers they "hold fast to that which is good." and buy more Buffalos year

after year. You will save time and money if you benefit by their experience and **BUY BUFFALOS.**

If you sell baby chicks—and the demand far exceeds the available supply—you can pay for a Buffalo by selling a single hatch right from the machine. This is possible because the hatching percentage of the Buffalo is so high as compared with its low price.

LAMP HOVERS—For the brood up to 200 chicks the Buffalo Handy is clean, convenient, and economical. It burns kerosene, and is really **HANDY**. It is recommended to their baby chick customers by such conspicuously successful plants as the Lord Farms of Methuen, Mass.

Oil-vapor Burners—The Buffalo "Never-out" is heavy cast iron with body enough to heat the oil to a perfect vapor. Burns kerosene oil, distillate, or gasoline, with equal facility.

COAL or GAS BROODERS—The commercial plant needs the Buffalo Brooder Stove, 52-inch hover, which Government Experts and Prominent Poultrymen everywhere pronounce "best." The exclusive feature is the high drum, permitting the hover to be raised to varying heights from the floor for the accommodation of all sizes of chicks and of different weathers, without **spilling heat at the top**. The auxiliary drum also keeps the room warm in cold weather. It's just the stove you want for 300 or more chicks.

NEW BUFFALO MAMMOTH

Capacity 3,600 Eggs. Floor Space 45 x 66 Inches. Height 80 Inches.

You know what **DIFFUSIVE VENTILATION**, **EVEN HEAT DISTRIBUTION**, and **ACCURATE REGULATION** made of my original Cyphers, Model and Buffalo—admittedly the World's Best Hatchers. Let me tell you that in Buffalo Mammoth the diffusive principle has been worked out perfectly, the heat distribution is as perfect; the regulation as simple and accurate.

The big **NEW** features are the small space needed—any ordinary house cellar will take care of several Buffalo Mammoths—and the fact that you can turn 3,600 eggs with a single motion of the hand—without opening a door—and in the fraction of a minute.

The air circulation is positive, all passing through a 12-inch electric fan which forces the air through definite and restricted channels. It is sufficiently rapid to distribute the warmth with absolute evenness throughout the hatcher.

No draft strikes the eggs, which are placed in separate compartments between porous diaphragms, and which form lateral channels for the air circulation.

The incubating chambers are thus ventilated by diffusion only.

Each tray compartment has an inner glass door making each 180 eggs a separate unit. One or more trays may be set at one time—the Buffalo is exceedingly flexible. The eggs are hatched in the same compartment in which they are incubated.

The Buffalo Mammoth has been tested out in the same scientific manner as my original Cyphers, Model and Buffalo. The regulation is as accurate and simple; the diffusive method of ventilation is a proved quantity; and the fan circulation through definite channels insures a perfect distribution of the heat. All features protected by letters patent.

RECOGNIZED HEADQUARTERS for the Best Orpingtons, all varieties, and the largest poultry breeders in the world.

SEND for our new CATALOG with history of all the Orpingtons.

EGGS —You will find our eggs an excellent investment. As we MADE all of the Orpingtons it is natural we know how to MATE for the best results. Our customers get the benefit of this knowledge, and are sure of the best and purest blood from us.

Safe delivery and SATISFACTION GUARANTEED, and backed by our reputation of 48 years. We have won over FIFTEEN THOUSAND FIRST prizes and numerous government-laying contests, showing our birds combine quality with usefulness.

Several thousand stock birds for sale. Advice free. Ornamental and song birds for sale.

Can You Afford To Buy Baby Chicks?

When you can start right with Queensbury pullets hatched in March and April and sold at eight to twelve weeks old at \$1 each.

We raise them in small flocks on free range, stand the brooder losses and can afford to do this because we use the same houses for later broods. Less than 250, \$1.15 each, and less than 100, \$1.25. No less than 50 to a customer. Better make your reservation at once.

QUEENSBURY FARMS, 123 North Main Street, Toms River, N. J.

DARK CORNISH — Finisterre

Offers a few choice exhibition cockerels sired by second cock at 1920 National Cornish Meet, Philadelphia. Out of nine-pound hens, which were all placed in pen classes same show. Also some very good pullets, now laying, weighing from six to eight pounds, at five dollars each. These are not exhibition females; will not last long at this price. A very few orders for eggs from premier exhibition matings will be booked. At Finisterre is the young pen that placed first at International Cornish Meet, Chicago, December, 1920. Flock mating, \$3.50 per fifteen eggs. Baby chicks, \$7 per fifteen. Satisfaction guaranteed.

Finisterre H. Hodgson, Prop. Waukesha, Wis.

SUPERFINE COLUMBIAN WYANDOTTES

Winners at Boston, 1921, and at Syracuse, 1920. Pens now mated. Eggs, \$3, \$5 and \$10 per setting. Guaranteed. Write for free mating sheet.

Courteous and prompt service with money-back guarantee.

H. T. FARRAR

AMES, IOWA

ckl; E. P. Saltonstall, 3 cock; Robert Treat Paine, Boston, Mass., 4 ckl, 1-2-4-5 pl; Isaac Sprague, Wellesley Hills, Mass., 5 ckl; S. H. Fessenden, 1 old pen.

Golden Penciled Hamburgs—John Lowell, 1 cock.

Silver Penciled Hamburgs—Isaac Sprague, 1-2 cock, 1-2 pl, 1 hen.

The Hamburg is a gentleman's fowl. Its varieties are among the oldest and best established of all the breeds. Interest seems to be centering in the Blacks and Silver Spangles. The best quality in these two varieties, in America, is annually cooped at Boston. In Blacks, such elegant style, green-black plumage, big, round, pure white lobes are not to be seen elsewhere. The Silver Spangled Hamburgs are strongly Spangled, no little mooney Spangles, and they show thoughtful breeding for many generations back. There were some good Golden Spangles at Boston this year.

W. C. Black Polish—A. H. Smith, 2 cock, 2 pl; C. E. Smith, 1 cock, 1-2 hen; J. W. McLeod, Lexington, Mass., 1 ckl, 1 pl; Ledge Acres Farm, No. Cohasset, Mass., 2 ckl, 3 pl.

Golden Polish—E. P. Stein, Manchester, Conn., 1 ckl, 1 pl.

Silver Polish—Schraver & Bond, Groton, Conn., 1 cock, 1-2-3-4 hen, 1 ckl, 1-2-3-4 pl.

White Polish—Idlewhile Farm, Sayville, N. Y., 1 cock, 1-2 hen, 1 ckl, 1-2-4 pl, 1 young pen; L. W. Johnson, Closter, N. Y., 3-4 hen, 2 ckl, 3-5 pl.

Bearded White Polish—E. P. Stein, 1 cock, 1 hen; Ledge Acres Farm, 2 cock, 2 hen.

Bearded Buff Laced Polish—E. P. Stein, 1 cock, 1 hen.

Bearded White Laced Polish—E. P. Stein, 1 ckl, 1 pl.

That wonderful variety, the Blacks with large white crests, lead the Polish class. Surely so marvelous a fowl can never pass in nothingness; surely they will survive to make glad the heart of fanciers as long as fowls remain one of our domesticated species. It is possible that their utility is not as good as the utility of commercial-farm Leghorns, but the fit alone do not survive. If they did, then what could have preserved the flowers through countless ages before man transplanted them to make cheerful his home surroundings, and yield their blossoms to decorate the bride, or to be laid upon the coffin of the dead? Utility is a necessary thing in this world; we must work and we must have useful animals. But eggs are not the only product of chickens.

There is a product that love and dreams and poetry are made of. It is less tangible but not less necessary to our existence. It is such a product that the Black Polish with its white chrysanthemum-like crest yields to those who breed it.

Among the W. C. Blacks at Boston, the 1st cock stood out as a wonderful bird; big white crest; great length of saddle and tail furnishings; deep green black sheen to body plumage.

TURKEYS AND BANTAMS.

A large entry of Bronze Turkeys. Smaller entry of Geese. A number of ornamental water fowl, such as wild duck, etc. A big class of bantams. In Black Breasted Red Game Bantams there were 6 cocks, 10 hens, 23 cockerels, 25 pullets. Sebrights not so strong, Golden leading. In Rose Comb Blacks, 11 cocks, 10 hens, 19 cockerels, 16 pullets. Buff, Partridge and White Cochins, and Light Brahma Bantams, good entries and good quality. A good showing of Mille Fleurs, and very attractive Malay Bantam cock. Over 400 bantams in competition.

Rough on Rats and Sparrows.

I read with considerable interest the article in the current issue of the Poultry Journal, by John H. Engel of Ohio, who told of his rooster killing a mouse.

I happen to have a fine Barred Rock hen, just commencing its second laying year, which from early pullet days, has been an unrelenting slayer of both mice and sparrows. Noticed the chick early last spring when it cornered and captured a sparrow in the chicken yard. A few minutes later when I looked again there wasn't a vestige remaining of Mr. Sparrow. Have noticed this Rock many times since stalk and capture a sparrow and know that it has several mice to its credit also. The bird shakes a mouse about as a dog would and after a few shakings there is very little life left in the mouse.

This particular hen is a wonderful layer also, one of the very best of my flock.

Michigan.

H. G. Nichols.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I am looking for a piece of cheap land which I can hold and get the increase in its value and at the same time make it my home and raise some fruit, poultry and other farm products, corn, alfalfa, wheat, oats, etc. I have been thinking some of northwestern Michigan, near Wellston and Manistee. At about what price can good land be obtained in this district?

I have also been thinking of Fall River county, South Dakota. I presume the climate is more severe here and there is less rainfall than in Michigan. I understand it is a fairly good fruit country. How would poultry do here? Hot Springs and the Black Hills cities ought to make a fair market for fruit and poultry, had they not? Or would more eastern markets be just as good or better for stuff produced in this country?

I have never farmed, but lived in a country town nearly all my life and was out in the country every day for several years in my work, which makes me more or less familiar with farms in general. I have handled horses and poultry all my life. I do not like the city. I have a wife and little girl 6 years old. I have a thousand dollars or more of available cash. Should I attempt farming with these resources? My wife does not have the best of health, having a cold which stays with her summer and winter, being worse in the winter. Her father, who is a physician, has mentioned that Arizona might help her. Can land be obtained there cheaply which would be O. K. for diversified farming, including some fruit and poultry? I do not figure on a strictly fruit and poultry venture in any of these localities, unless that would be the best solution of the situation.

Do you know of any other country which you believe would be beneficial to a continual cold, and where land conditions would suit as above outlined. Of course I would not have to farm; I could do something else, as I am now doing. But I think I would like the outdoors better than city life; however, I would want to be close to town.

Can you tell me the nature of the soil in the places I mention, also the water?

Iowa.

C. W. Beck.

Land in the section of Michigan to which you refer can be bought for \$25 an acre up for raw land. Improved farms vary in price according to location and improvements. The section of South Dakota you name is a rugged, cold and trying country. Poultry and fruit would do well there, but the markets are not all that could be desired. I would by all odds prefer northern Michigan. You will find it rather difficult to buy a desirable farm and the implements and stock necessary, on a capital of \$1,000. Land in the irrigated districts of Arizona can be bought for \$100 to \$600 an acre, improved. Unimproved land can be bought for much less.

The soil in the Michigan section mentioned is a light sandy loam. It is splendid soil for grains, grasses and small fruits. The soil in the South Da-

Seed Book FREE

Every year, for 34 years, thousands of people have adopted Olds' Catalog as their farm and garden guide. The carefully tested and selected seeds it offers have produced heavy field crops and successful gardens everywhere. Customers have long since learned that

Olds' Catalog Tells the Truth

Its descriptions, both in word and picture, are truthful in every respect. You can positively depend on garden, flower and field seeds, potatoes, plants and bulbs listed in this book being exactly as represented. All seeds conform to the strict Wisconsin seed laws. When you buy Olds' seeds, good yields are assured from the seed standpoint. You take no chances.

WHY TAKE CHANCES?

Find Out What an Incubator is Made of Before You Buy

Send for Our **FREE Catalog** and We Will Send Sample of Material Used in Our Incubators and Brooders

Then you will know which machines are built best, which will last longest and which will give you the most value for your money. Year after year these unbeatable Wisconsin Incubators have proved their superiority over all other machines, regardless of price. Below are a few of the record-breaking hatches taken off by Wisconsin outfit.

Wisconsin Incubators Have Double Walls

It pays to investigate before you buy. For example: Wisconsin Incubators have double walls—the outer wall is of California Redwood and the inner wall is of insulating board with dead air space between the walls. Hot water heat—double glass doors—**COPPER TANKS**—self-regulating. Roomy nursery under egg tray. Incubator is finished in its natural color, showing the high grade California Redwood lumber used—not painted to cover up inferior material. Both machines shipped complete with thermometers, lamps, egg tester and book of directions; **all set up ready for use** when you get them. Freight paid east of the Rockies.

You Take No Risk!

I have been advertising in this paper for years. The publishers know me and know I do just as I agree. One good hatch will pay for a Wisconsin outfit and more. Send in your order direct from this advertisement or write today for our free catalog. Address

Natchez, Miss.
Wis. Inc. Co., Racine, Wis.
Sirs:—Am glad to inform you of the results I obtained with your incubator. Set it with 180 eggs and hatched 176 chicks. I have four different incubators but prefer the Wisconsin as it is perfect in every respect and very easy to handle.
Yours,
T. L. STEVENS.

Hutchinson, Minn.
Wis. Inc. Co., Racine, Wis.
Gentlemen:—Last March we ordered 12 incubators from you and were so well pleased with them we ordered 12 more; also one for a friend. My bird man ran all 24 incubators and both he and I were well pleased with the results and expect to order more this spring. Yours truly,
J. W. NIGHTINGALE.

Your garden needs a Planet Jr.

The success of your garden depends on thorough cultivation, which a Planet Jr. will do in a fraction of the time required by old methods, and with a fraction of the labor. Half an hour a day by the Planet Jr. method will keep the average home garden producing quantities of fresh vegetables all summer. For work in a small or moderate-sized garden, No. 17 is a remarkably handy and adjustable tool.

There are 54 other Planet Jr. Seeders, Wheel Hoes, Horse Hoes, Riding Cultivators, farm and garden implements for every purpose.

Write for the free, 72 page, illustrated catalog describing Planet Jr. Implements and giving practical suggestions for their use.

We have a place of 24 acres and expect to keep about a thousand White Leghorns and fifty colonies of bees. We have out 1,800 strawberry plants, 500 raspberry plants, also currants, gooseberries, etc. All products can be sold in Pekin and Peoria. I. E. Wilson. Illinois.

I would cut out the Northern Spy and Rome Beauty apple trees. You certainly should have some of the Stark Early Elberta peach trees. You will find Mammoth Gold plum too tender for your locality. Three years ago the trees of this variety winter-killed in southern Illinois. If you desire plums every year and trees entirely hardy, plant Terry, Surprise, Wyant and Desoto. I would cut out your entire plum list except Omaha and Tatge. You should have the Worden grape, by all means. It is better fruit than Concord, larger, earlier, and the vine is as hardy.

* * *

While I am a long ways from St. Louis, Mo., nevertheless it has been my home for a great many years, and I am planning to make it my home in the future, for all time, I hope.

I have a dear friend who has a farm, and out of regard for me it has been offered to me under very enticing terms. This place is located twenty miles from the city, on a good auto road. It comprises eighty acres, but has been sadly neglected, this being due to the fact that it has been leased for years, the friend having purchased it as an investment. It is still a splendid investment from a real estate point of view.

This place has been "wheated" to death. You probably are aware of the nature of the soil in these parts. I had thought to plant clover, apply phosphate to the soil, as I think it contains enough limestone, a small limestone quarry being on one portion of the farm. I could sell almost anything right at the door. I wish to go in for poultry, but

Let Us Fill the Idle Space in Your Garden with This Mammoth Fruit Collection

You can have Ripe Red Raspberries ninety days after planting! Big Melting Dewberries the next summer! And loads of Red, White and Blue Grapes, - and delicious Pears and Apples - in just a few years! Almost without cost to you! Read our liberal offer, and get this Mammoth Fruit Garden started NOW.

If you would enjoy having a Fruit Garden and Orchard like this, - Seventeen Trees, Vines and Berry Bushes, just plant this Mammoth Fruit Collection.

SELECTED FRUIT PLANTS

The Red Raspberry and the Dewberry plants in this collection have been selected from fields that have made high records for heavy production of quality fruit. By following the Instructions, you can secure new plants every year from these we send you, and extend your planting every season. The REX everbearing red raspberry will begin to bear in ninety days after planting, and continue until fall.

ONE SNOW APPLE

Deep red skin, almost black. Pure white flesh of peculiar rich flavor. Very sweet and juicy. Bears big crops at an early age. A Russian variety and very hardy.

ONE WEALTHY APPLE

Another favorite Russian variety. Yellow, overcast and streaked with red. Flesh is sweet, melting and tender, but slightly tart. Has few equals for every purpose.

APPLE AND PEAR TREE GRAFTS

These apple and pear tree grafts are produced by a method that insures every good quality. From bearing trees, the new branches ("scions") are cut and carefully grafted to a root of the same type. The fruit tree graft, thus complete, takes root as soon as planted, makes rapid growth, and in just a few years bears heavy crops of choice fruit. Each apple or pear tree graft is about a foot in length.

2 REX Everbearing Red Raspberry

A picking every week from June to October. The new canes bear first year, 90 days after planting. Berries large, firm, sweet, and of delightful flavor. A most dependable new fruit.

2 Improved Lucretia Dewberry

Vines covered every summer with immense clusters of big, sweet berries. Rich, winery flavor. Very juicy. Individual fruits average 1½ inch long and an inch through.

"CALLOUSED GRAPE CUTTINGS"

From selected vines in the best of the great Southern Michigan vineyards, cuttings about nine inches long are taken, and buried in damp, cool pits until they undergo a process called "callousing." The cuttings will then take root as soon as planted. The "Calloused Grape Cuttings" in this collection are all produced in this manner. They grow rapidly, make strong, healthy vines, and bear large crops.

ONE KIEFFER PEAR

Large, angular, and slightly irregular in shape, this old variety is the standard winter pear everywhere. Dark green. A splendid keeper, at its best in late winter.

ONE BARTLETT PEAR

Yellow skin with red blush. Flesh sweet, juicy and spicy flavor. Very mellow when ripe. Can be picked and eaten from the tree. Yields heavily, begins to bear early.

Satisfactory
Growth
Guaranteed!

3 DELAWARE GRAPE - Red

Large, well-shouldered, compact bunches of bright red, beautifully flavored grapes. Makes jelly or grape juice of finest flavor and aroma.

3 NIAGARA GRAPE - White -

Immense clusters of delicious, waxy-white grapes. Remarkably sweet and juicy. Good for wine, preserves or jelly. In flavor it much resembles the Concord. A prolific bearer.

3 CONCORD GRAPE - Blue -

The best blue or purple grape grown, and the universal favorite. More Concord grapes are grown and sold every year than all other varieties, on account of its wonderful quality.

Complete, Illustrated Instructions for Planting

are wrapped in each package. They are fully illustrated with pictures and diagrams, showing just what to do, and how and when to do it. By following these simple directions you will have success.

DAY-OLD CHIX -- DUX

Buff, Brown and White Leghorns, Anconas, Barred and White Rocks, White Wyandottes, Mammoth Pekin and White and Colored Indian Runner ducklings.

North Chelmsford, Mass.,
May 18, 1920.

Dear Sirs:

Chicks arrived in fine condition today. Everyone alive and ready for business. Am well pleased with them.

Yours truly,
W. ROBERTSHAW.

North Chelmsford, Mass.,
January 2, 1921.

Dear Sirs:

Got 600 eggs during month of December from 49 (forty-nine) pullets raised from chicks purchased from you last year. Will want 200 more this season. Yours truly,

W. ROBERTSHAW.

The above two letters, unsolicited testimonials from the same customer (we have hundreds more just like them), prove conclusively that our method of breeding, the scientific elimination of thick, crooked pelvic bones, small egg chambers, and other physical defects which have a direct bearing on egg production: which has been carried on for years by our experts, has improved the efficiency of each succeeding generation, until today they have no peers and few equals. Write for our **MONEY-SAVING PROPOSITION** on day-old chicks and ducks for 1921 delivery. **IT WILL PAY YOU.**

Feed **NATURE'S OWN** egg stimulant for heavy egg production, **BETTER FERTILITY** and virile, healthy germs. Every year you go without it you pay for it many times over in loss of egg production or low fertility.

NIAGARA FARM

POULTRY and BEE KEEPING
31½ Main St., Warren, Ohio.

gradually I should like to put in a crop that would bring me in some good return the first year, under the above conditions. Could you give me any advice in this line? I am not green at the farming game. Sweet potatoes do very well in this locality, but I do not know whether the soil is too run down to permit of much profit at first.

As I am none too flush with this world's goods, I thought to go slowly at first and earn money during the winter months in the city. In this way I should think I need have no fear of really going broke before I got started.

I also had thought of strawberries as a good paying proposition. If you can give me any information from the facts as I have stated them, I will be more than thankful. Does this farm sound good to you? Do you think I am safe in sinking my all into the place. I have a wife and two children, 12 and 14 years old, and a reliable man who might go in on shares with me.

California. W. C. Fisher.

This land is evidently not in condition to return a profitable crop the first year after you take it. It should be "brought back" by the use of barnyard manure, if this can be secured. The soil, I think, regardless of there being limestone beneath the surface, you will find that the land needs not only phosphate but lime. It can be brought back by the plowing under of clover and rye. I can not see why you should not restore this land. The location is certainly very good, being near St. Louis, which is a good market. I think this place would pay run as a poultry and small fruit farm. I would not assume the responsibility of determining whether or not you were safe in sinking your all in the purchase of this farm.

* * *

In 1915 I purchased a small farm of about eight acres, forty-five miles from Boston and just over the state line in New Hampshire. At that time I was a tenderfoot as regards poultry raising, fruit growing and gardening. However, in three years' time I gained some valuable experience on these subjects without paying too dearly for my knowledge.

The present season is the third that I have been away from the farm, and it has been used only as a summer home by my family. Now I am looking forward to the time I can return home and build up a poultry, fruit and small fruit farm, together with some truck raising. I propose to begin on a small scale and gradually build to a one-man capacity, which I believe will be about a thousand laying hens. Being so near Boston, probably the best market in the country, I anticipate no trouble in disposing of all my poultry products, both eggs and meat.

The soil is largely clay loam underlaid by clay or hardpan, and all kinds of fruit grows well on about half of it, the remainder lying too low for fruit trees; but I think by under-drainage that it would do for bush fruits, though I plan on putting the larger part into crops.

The first season I set out about forty fruit trees of various kinds, including apple, peach, plum, sweet and sour cherries. The greater part of these have lived and grown well, considering that I have been at home but a short time during the last two seasons to care for them. I plan on setting out ten more trees each of Delicious, McIntosh Red, Stayman, and King David, and six each of Senator and Jonathan, together with a few more Wealthy.

I know you discourage peach growing in the north, and we are on the very northern limit and have a crop only about once in four years, and then there is good money in it, so I propose to interplant with peaches. Plums, pears and sour cherries do well and I want a few more trees of each. Sweet cherries are an unknown quantity. The trees I set out have mostly died, but if I can grow a few trees of about three varieties I can sell all the fruit at the door. I also want a few quince trees.

I can sell all the small fruit I can raise, and have planned on three dozen each of Red Cross, Perfection, Wilder, and some variety of black currant and of Downing, Oregon Champion, and Carrie gooseberry, 150 Lucetia dewberry, 200 each of King and Brilliant raspberry and Eldorado blackberry, 100 Royal Purple and Plum Farmer black raspberry. Local help can be obtained for berry picking. Also plan on growing strawberries

FRY BROTHERS CO. LAFAYETTE, INDIANA

and have selected Early Ozark and Charles First for early, Senator Dunlap and Dr. Burrill for second early, Gibson and Uncle Jim for midseason, and Aroma and Heritage for late varieties.

What do you think of my choice of varieties? Is my program too ambitious? I propose to start on a small scale and enlarge each year, not setting out any trees or small fruit until after at least one season's cultivation. The trees and much of the small fruit would be in the chicken yards, and I probably would use a garden tractor for cultivating the remainder and for farm purposes. More land can be purchased close by, and I would raise much of my feed and keep a cow or two and some swine.

Virginia. R. H. Rockwood.

No, I do not think you are "too ambitious" in your program. Advise you to cut out the Stayman apple trees. You are too far north for this variety to do its best. Be sure to include some Wealthy apple trees in your planting. As you have determined to plant peach trees, I will not dwell upon this question. However, I think it is a mistake. Do not plant sweet cherry trees.

* * *

In answer to R. F. Patten, Illinois: Grape growing is the leading industry in the section of which the town of North East, Pa., is located. This grape land cannot be bought for less than \$1,000 to \$1,500 an acre. The country is level from the lake back to the hills, a distance of from three to five miles.

The elevation of the greater part of Otsego county, New York, is about 1,400 feet. At Summit Lake, about eight miles from Edmeston, the elevation is nearly 1,800 feet. There are no commercial orchards in this county. Each farm has its neglected home orchard.

Grapes cannot be grown commercially in that county, the season being too short for the fruit to mature.

* * *

E. Rush, of Halsey, Ore., has complied with the request of C. D. Bush, of Oregon, for information regarding tree planting. Mr. Rush writes as follows:

Fruit and nut trees are very good to put on land such as described. South slopes are all right if there is no danger of late spring frosts. I have seen an orchard with two elevations, only four feet variation, and one would be killed by frost while the other was not. I have grafted filberts onto wild hazel and got several of the grafts to grow. After two or three years all but one graft died. I do not care to try that again. I would buy either nuts or grafted trees. The trees are best except for the experienced man. Chestnuts will do well and require less care than any other trees. They are very sure to bear. I have not missed a crop since they first bore, five or six years ago. About cherries, I would raise only large, late Montmorency, Late Duke, and English Morello. I have fourteen or more varieties and I seldom get more than a taste of any others except the varieties mentioned.

I saw a map of the chestnut bark disease district—I think, a government map—and it showed only a small district near New York City. I have read that the government has experts watching, and if a tree shows any sign of the so-called blight, it is taken care of at once. I think there is little danger. If I wanted to import any variety of chestnut from the eastern part of the United States I would ask the Department of Agriculture where I could secure trees and be safe from the blight.

* * *

Do you know anything about conditions, climatic and otherwise, prevailing in the southern part of Baldwin county, Alabama, say, in the neighborhood of Elberta, Foley, etc.? What are the prospects for the Satsuma orange and pecan nut industries in that section? How would a combination of Satsuma oranges with pecan nut trees and poultry raising appear to you in that section? Is the soil down there suitable for the carrying on of the three industries mentioned? How about markets, etc.?

What I am principally interested in knowing about that section is, would a commercial

like produces like

Just in proportion to what you feed your birds so will they produce for you.

At this time of the year when the production of eggs is the chief factor on every poultry farm you should assure yourself of maximum egg production thru the use of guaranteed pure and wholesome feeds.

Unsuitable food will not only impair the health of your stock and limit production, but will also seriously affect fertility and the constitution of the progeny.

SEND TODAY

HUNDREDS

Are sending for our Advertising and Sales Booklet, all anxious to learn the Knack of Advertising and Selling—and How to Do It.

"HOW TO ADVERTISE AND SELL PURE BRED POULTRY" will be sent you without obligation.

It will tell you how big breeders have reached fame and fortune—and how you can acquire this important knowledge in a few weeks that ordinarily would require years of labor, grief and expense.

YOU MUST KNOW how to sell your birds to the best advantage. A postal will bring the booklet. Do it now.

SPRINGFIELD ADVERTISING CORPORATION
Springfield - - - - - Illinois

poultry plant, with Satsuma orange and pecan nut trees, offer a good prospect of making a fairly reasonable living, with a little each year to put by for a rainy day? Would also like to know something about the climate, year in and year out; also the nature of the drinking water. Is the climate, considered the year round, as well as the drinking water, conducive to health and longevity?

How does the section mentioned compare with the different parts of California for carrying on the three industries in question?
Alabama. F. S.

The section to which you refer is one well suited to the profitable production of the Satsuma orange and the pecan. There are many good orchards and groves there, and thousands of acres are now being set to trees. The climate is very mild and even, and the market and social conditions are fine. It ought to be a very desirable section for the production of eggs and market poultry.

The soil is in most places a sandy loam with a clay subsoil. This is ideal soil for the purposes you wish to use it. As stated, the climate is good the year around. The drinking water is pure, being secured, in most cases, from deep wells.

As between this section and the best orange sections of California I would prefer the latter.

* * *

I have a farm in Jackson county, Michigan (dry loam soil), and wish to set out the various fruits that can be raised here, in sufficient number for family use in the poorest seasons. Wish you would advise me of the most suitable apples, pears, plums, cherries, peaches, currants, gooseberries, raspberries, strawber ies, grapes, etc., for this location, for family use. It probably would be necessary to have enough extra to insure plenty in bad seasons, so that I would have a little surplus for which I have a good market. Would appreciate any information you have on planting, etc. Harold J. Smiley.

Michigan.

Advise you to plant Winter Banana, McIntosh Red, and Wealthy apples. Do not plant many pear trees, as your section is not particularly adapted to pear culture. Plant Seckel, Lincoln, and Vermont Beauty. In your selection of plums stick closely to the American varieties, planting Desoto, Terry, Surprise, and Wyant. For family use select the Early Richmond and Montmorency cherries. You will need hardy peach trees. Plant Eureka, Stark Early, Elberta and Krummell. Investigate and learn if there is not some local peach successfully raised in your vicinity. Plant Fay and Red Cross currants and Oregon Champion gooseberry. The Cumberland is the best black raspberry, while the Royal Purple is best of all. Plant some of each. Select the Worden, Concord, Moore's Early, Luceil, and Niagara grapes. Make all plantings next spring.

* * *

Could you give me a little information about a part of Wisconsin? I have noticed an ad of a land company at Ladysmith, Wis. The proposition looks good on paper. What I want to do is to get a small farm, say, forty acres, and engage in poultry and hog raising.
Kansas. R. L. Lively.

This is one of the many cut-over land propositions now being worked in Wisconsin. The lumber companies cut off the timber and sell the land to settlers. The companies claims are highly colored, as a rule. Do not buy until you gave gone up there and made a thorough investigation of the land and all the conditions. Most of this cut-over land will produce wonderful crops of clover and potatoes. It is best suited to dairying.

STOP! POULTRY PROFIT LEAKS

Of course poultry raising pays—but poor methods mean leaks that eat up most of the profits. Don't export money—follow the safe plan.

X-RAY WAY SAVES THE DAY

The X-Ray Incubator stops the leaks—gets you a larger percentage of chicks than any other. The X-Ray Way is the Right Way.

Feed and Care of Baby Chicks.

Continued from page 155)

well and be healthy. When the chicks are put under the hovers the temperature should be in the neighborhood of 100° F., not much below the temperature of the incubator from which they came. For the first day or two under the hover this temperature should be maintained, and then gradually lowered during succeeding days to harden the chicks, until at the end of two or three weeks 85° will suffice. Under normal conditions at the end of six weeks the chicks are practically weaned from artificial heat.

Have the hovers well littered, so that the little chicks will find a comfortable resting place, and a warm one. An inch of sand, with a coat of barn chaff does very well. Do not have long stuff, but short, so that the chicks will not become entangled in it.

When the colony brooder stoves are used they are generally placed in a room approximately twelve by fourteen feet in size, with the stove and hover in about the center. Under such circumstances there should be a strip of inch mesh poultry netting about eighteen inches high, and long enough to make a circle about the hover reaching about one foot or eighteen inches out from the edge of the hovers on all sides. This fence keeps the baby chicks, which may number from two hundred fifty to three hundred in a flock, from wandering away from the source of heat, and getting chilled. This protection is extremely essential, as it prevents chilling and trouble from crowding later on. This fence is used for about three or four days, and then taken up or enlarged during the day and again brought up closer to the hover at night. This training of the baby chicks is very important.

Watch the brooder stoves or source of heat carefully. The ~~feed~~ ^{temperature} is ~~very~~ ^{important} up to the man.

Feeding the Baby Chicks.

The matter of nourishing the baby chicks is of paramount importance. Success depends largely upon what we give the growing chicks to eat. If possible we should get the rations down to a system and then be as regular as possible, for baby chicks soon become creatures of habit. The following formula and methods have given good results in the hands of the writer, and the same have been used on innumerable poultry plants to his knowledge.

When the baby chicks are first placed in the brooders they should find drinking fountains filled with clean fresh sour milk. The sour milk is best, but semi-solid buttermilk can be used, if the amount needed is to be large, and if the skimmilk is not at hand at a price that is reasonable. Sprinkle a little bright, fine grit around on the litter, for the babies have no teeth.

Next morning give five feedings of any good chick grain ration. An excellent home-mixed ration consists of equal parts of fine cracked corn, pinhead oats, and fine cracked wheat. Teach the chicks to pick it up clean. Keep this up for the first week, supplementing with sour skimmilk and water all the time. Whistle each feeding time, or otherwise teach them to come at some call. Take the place of the hen.

At the beginning of the second week leave out the noon feeding of scratch grain and place wheat bran which has about five percent of dry fine cut bone

Blatchford's Chick Mash is sold in 100- and 25-lb. bags and in 4-lb. cartons. At your dealer's

If you are going to raise chicks this spring you want to raise as near 100% of them as is humanly possible. You do not want to see about half of them die off because they are *improperly* nourished, or because they are *under* nourished. That is usually the fate of 40 to 50% of all the chicks that are hatched. But it is an *unnecessary* loss. It can be *prevented*. It can be prevented by *starting* and *growing* your baby chicks on *Blatchford's Chick Mash*.

Blatchford's Chick Mash is the new name for *Blatchford's Milk Mash*—the milk-substitute mash that shields young chicks from white diarrhea, bowel trouble and leg weakness—the mash that keeps chicks in *condition* all the time, and *growing* all the time. *Blatchford's Chick Mash* is new in *name* only, however. In all other respects it is identically the same as *Milk Mash*—the feed regarding which H. Cecil Sheppard, Berea, O. says, "I would not attempt to raise chicks without it"—the feed upon which Chas. G. Pape of Ft. Wayne, Ind., starts and grows all of his famous prize winning Black Minorcas—the feed that hundreds of other prominent breeders and thousands of small and large poultry keepers everywhere put implicit confidence in because it *starts* their chicks *right*, *grows* them *rapidly* and *matures* them *early*.

4 lb. Trial Carton for 50 cents

I have been feeding Blatchford's Milk Mash (now Chick Mash) several seasons, last year raising about 3000 without a single case of bowel trouble. Out of 1150 hatched about three weeks I have lost 4. Harry L. Bancroft, Kinderhook, Ill.

I have used your Milk Mash (now Chick Mash) for a number of years and there is nothing better as a starter for baby chicks. Out of 100 chicks this season I have only lost 2. This was my own fault, caused by neglect. Chas. W. Huber, 220 West Allmon St., Salem, Ill.

I have been feeding your Milk Mash (now Chick Mash) and have raised better than 97% of the number I hatched this spring. I have cockerels that weighed 41-2 lbs. at three months of age. H. A. Davies, Dodgeville, Wis.

Raising chicks without Blatchford's Milk Mash (now Chick Mash) is what Sherman said about war. I am like Mr. Sheppard of Berea, Ohio—I would not attempt to raise chicks without it. L. D. McVey, 3208 Live Oak Street, Dallas, Tex.

Blatchford's Milk Mash (now Chick Mash) is the only thing I have found that absolutely prevents white diarrhea and the chicks do well on it. J. E. Sloan, Prop., City View Poultry Farm, Ashland, O.

Send this coupon and 50 cents for a 4 lb. trial carton of Blatchford's Chick Mash—postage prepaid

Blatchford Calf Meal Company Waukegan, Ill. Dept. 6022

Every Shape and Color Special. They also won 1, 2, 3 in the bred-to-lay class. The crowning feature came when for the third time (in three trials) they won Champion Bird of the Entire Show.

Wherever intelligent man's foot has trod, the name HALBACH will be found associated with supreme quality in WHITE PLYMOUTH ROCKS. Do you want real quality, heavy laying birds and eggs? They will take you out of the rut. Then send for our new mating list and price sheet—all FREE.

H. W. HALBACH & SONS, R. No. 1-B, Waterford, Wis.

S. C. White Leghorn Cockerels

These cockerels are much larger than the average. Have large red combs and are real beauties. Trapnesting for years, we have produced a strain that is hard to beat. Cockerels from 200 to 240 eggs strain, \$8.00, and from 240 to 311 egg strain \$10.00. Also a few cocks from Lady Virginia, record 311, \$15.00.

HATCHING EGGS AND BABY CHICKS

From high average hens that when hatched and raised will grace the yards of any poultryman. Eggs \$10.00 and \$15.00 per 100. Chicks \$20.00 and \$30.00 per 100. Write today for mating lists and get some of these real bargains.

BARLOW LEGHORN FARM

Box 112

SUGAR GROVE, PA

—AMERICA'S GREATEST POULTRY REMEDIES—

RAISE 90% TO 100% OF YOUR CHICKS

KEEP YOUR CHICKS ALIVE. OTHERS ARE DOING IT; SO CAN YOU.

Don't let your chicks die with white diarrhea, gapes, going light, weak legs, stunted, not developing; give them Wacker's Chick Tablets in the water from the start, then watch 'em grow. By using these tablets you make chick raising a pleasure.

BETTER THAN GREEN FOOD

Just dissolve WACKER'S B-T-G-F TABLETS in the drinking water. Your chickens will be in prime condition, and an increased egg production will result. No meat scraps are necessary. If you are not satisfied we will return your money.

ROUP WILL NOT DEVELOP

in your flock if you watch the chickens' eyes. As soon as they begin to water or small bubbles form in the corners or the nose begins to run, give them WACKER'S ROUP TABLETS. You can throw the axe away. **MONEY BACK IF NOT SATISFIED.**

All Tablets, 300, 75c; 1,300, \$2.50; 5,000, \$7.50. Positively Sold Nowhere Else.

Egg-A-Day S. C. Buff Orpingtons

Won best display at the great Boston Show, winning 1st old pen, 1st young pen, 4th cock, 4th pullet, 5th cockerel and 6th hen, getting a bird placed in each class. If there is any classier show than Boston, outside of Madison Square Garden we don't know it. Cockerels at \$20, \$25 and \$35 that will please you and improve the egg-laying qualities of your Buff Orpingtons.

EGG-A-DAY FARM, Capt. I. Brooks Clarke, Meriden, Conn.

in it before them in low pans or hoppers. For the first day or two keep this before them for only about three hours, but after that for the entire time. Give green food in sparing amounts, such as cut-up sprouted oats. There is nothing better.

At the beginning of the third week substitute a good chick dry mash for the wheat bran and bone. A home-made mash can be made of three parts of wheat bran, one part each of wheat middlings, ground oats, cornmeal, and meat scrap; adding a part of dried butter-milk, if desirable.

Cut down to three grain feedings in the third week.

Do not forget that the sour skimmilk and clean fresh water and green food are as important as the grain and mash. Keep the chicks exercising, for idle chicks develop bad habits, such as toe-picking. Get the chicks out on the ground as soon as possible after they are a week old. Mother Earth is good medicine for them. If the weather is bad have some sods which can be inverted and given to the chicks to pull at and scratch in. They'll enjoy them.

Success in Raising Turkeys.

To raise turkeys successfully, one must learn their habits. The fowl was originally a wild bird, and still likes the timber and seclusion. In the early spring the hen will conceal her nest in a most remote place, and if she is followed she will wander around for hours, eventually sneaking into the nest from the far side. Very seldom have I known turkeys to make their nests in the chicken houses or barns, through choice. Sometimes they do so, if raised as pets, but pet turkeys are not profitable.

The eggs hatch much better if left in the damp, cool nest. Unlike chicken eggs, they are not easily chilled. Eggs laid out in our pasture this spring during a two days freeze resulted in a hatch of fifteen out of eighteen eggs. The turkey hen often remains on the nest as long as three days after the eggs hatch, or until the young ones begin to forage for food. When the young poults start out with the mother hen, they pick up small bits of dirt and stone and peek under leaves for small bugs. The mother will forage with them, feeding on bugs, grass and weed seeds, until they are about one-third grown. Then she willingly brings them up to the farm yard. If left to care for the young, the turkey hen almost always raises eleven out of twelve.

More young turkeys die from over-feeding than from disease. If left to run in the open fields and woods, they require very little hand feeding and no grain. I have tried both methods of raising turkeys and find that the ones running free and given no care are more thrifty and get a more vigorous growth, and at marketing time they outweigh the hand-fed ones by three to four pounds.

Poultry houses do not care to buy young toms weighing under sixteen pounds and hens under eleven pounds, and will pay from 3 to 5 cents more per pound for them weighing that much or more.

Mrs. Earl Bradshaw.

Kansas.

MADISON SQUARE GARDEN POULTRY SHOW.

(Continued from page 153)

a splendid concave of saddle to properly carried tails. Such birds show careful selection and intelligent mating. That is the difference between them and the roughneck type of so-called utility White Leghorns.

Cornell appears to concede this fact. In their description of a White Leghorn male, which was lettered on a large placard in their exhibit, there appeared the statement: "The tail can be carried at any angle; a high tail is undesirable."

One of the most impressive things in the Cornell exhibit was a display of the raw material that a hen actually consumes in one year. This consisted of six ten-quart pailsful of water, 60 quarts in all; 45 pounds of grain scratch feed; 35 pounds of mash, which in quantity was about equal to the quantity of scratch feed, although this quantity of mash weighs ten pounds less on the scales; 3 pounds of oyster shell; 2 pounds of grit, and 15 pounds of green food, including cabbage and carrots.

The government exhibit contained three Barred Plymouth Rock hens that had laid 199 eggs, 216 eggs and 205 eggs respectively during the past year. It has been said that you can combine utility with Standard quality in some breeds, but not in Barred Rocks. Mr. Lamont proceeded to find out. There was no pedigree breeding for eggs back of the hens he showed at New York, but there was a whole lot of breeding for Standard quality back of them, and the three half sisters that he cooped had a combined production of 620 eggs for the year, an average of 206 eggs each. With such records coming from the poultry farm of the U. S. Department of Agriculture, it begins to put breeders who are not producing Standard quality in the class of those who are incapable of producing it.

DELANO SELLS WHITE ROCKS.

The biggest and most important sale in recent years was consummated during the Garden show with the transfer to Wilburtha Farms, C. J. Fiske, Prop., Trenton Junction, N. J., of the entire flock of Owen Farms White Rocks. M. L. Chapman, superintendent of Wilburtha, is one of the most influential White Rock men in America. He got his schooling down in Connecticut where the going was fast, and was a pupil of Harry Graves, the originator of the modern White Rock. Both the Owen Farms and Wilburtha lines are of the Graves strain, and there is no question about the two flocks amalgamating and the matings "nicking." Chapman has beautiful form and quality in his birds, but the Owen Farms line has somewhat more bone and substance, and the combination of the two, under the guidance of so competent a breeder as Chapman, will make Wilburtha Farms headquarters for good stock.

M. L. Chapman, General Manager,
Wilburtha Farms.

As a rule, Chapman takes defeat in the showroom about as gracefully as any man, but he was considerably wrought up this year. He said that he had a curling iron in his pocket and could widen the saddles on his White Leghorn males just as wide as the judge wanted them, but he did not want to get into that kind of a game. We thought that Charles D. Cleveland summed up the whole situation, not with special reference to this class, but with reference to all showing, when he said: "They say it is faking

SINGLE COMB— BLACK LEGHORNS

"LADY BEAUTIFUL"

PULLET LINE ONLY.

BARRED PLYMOUTH ROCKS

OLD LADY BEAUTIFUL was perhaps one of the two greatest females yet shown at Madison Square Garden. Her progeny has produced and reproduced until my pullet-bred line (and which, by the way, is all I breed) has attained its present high position among the various strains of Barred Rocks.

At State and National Meets of the American Barred Rock Club the "Lady Beautiful Strain" has won high honors.

LADY BEAUTIFUL birds won at Baltimore as follows: 1st, 3rd and 5th hens; 1st, 2nd and 5th pullets; 1st and 3rd cocks; 1st and 2nd cockerels.

STOCK—Always some choice pullet-bred males for disposal to the discriminating purchaser.

VICTORIOUS

1921

MADISON SQUARE GARDEN

SHEPPARD'S "Famous" Anconas

The great national thrift bird—have just recorded their 13th consecutive victory at Madison Square Garden Show, where, on January 20th-24th, they won gloriously for H. Cecil Sheppard as follows:

ROSE COMB

Cock—1, 3, 4, 5.
Hen—1, 2, 4.
Cockerel—1, 2, 3, 5.
Pullet—2, 3, 5.
Pen, Old—1, 2 (2 ent.)
Pen, Young—1, 3.
(2 ent.)

Special for best Rose Comb display.

SINGLE COMB

Cock—1, 2, 4, 5.
Hen—2, 5.
Pullet—1, 4.
Pen, Old—1, 2 (2 ent.)
Pen, Young—2, 3.
(2 ent.)

Special for best Single Comb display.

The income from hens is not half what it should be, because there are so many poor layers in thousands of poultry houses. Concentrate on winners! Concentrate on Sheppard's "Famous" Anconas—that not only win the best prizes—but hold the world's egg-laying records for flock in the hands of amateurs and also record for single bird.

Mail me a postal for large FREE catalog.

H. CECIL SHEPPARD
BOX A-407 BERE, OHIO
"Famous" Anconas—The great winter layers

only when you get caught. I do not think that it should be a case of matching wits between breeder and judge. It is a question between the breeder and the public. I do not believe it is good business to sell over-fitted chickens, provided, of course, that a man wants to stay in business. It is not the way to build business and make a permanent success. If I were in the glove manufacturing business and sold slightly defective goods as 'firsts,' I would soon have to go out of the glove business and start manufacturing bird cages or something else."

There was a good entry of Cornish brought over from England. A couple of Englishmen were in attendance with the birds.

The Poultry Fanciers' Club met during the week and disbanded. It is planned to turn over the \$125 in the treasury to the American Poultry Association.

AMERICAN CLASSES.

Barred Plymouth Rocks—E. B. Thompson, Amenia, N. Y., 1-2-3-4-5 cock, 1-2-3-4-5 hen, 1-2-3-4-5 ckl, 1-2-3-4-5 pullet, 1-2-3-4-5 old pen, 1-2-3-4-5 young pen.

Thirteen cocks, 16 hens, 32 cockerels, 18 pullets, 5 old pens, 6 young pens.

Several breeders competed this year, and we commend them all for their courage. The prizes as usual went to E. B. Thompson. Not a weak spot in his exhibit. Take the foremost breeders in any other class and you will find that they are a little weak in cocks one year or fall down on hens the next year, or their cockerels are not quite as good as last year, or they win on pullet but she has a bad comb. Not so with E. B. Thompson. He is the greatest breeder in America today. There is no weak spot in his entry.

Neither are there any weak spots in his chickens. Let other breeders make a hobby of narrow barring and correct it by breeding meat on the wings to give firmness. Thompson's Ringlets are not one-feature chickens; they are whole chickens. They have heads, type, bodies, tails, yellow legs and beaks, straight barring, clear white bars, under-barring—everything. Not a chicken in his whole lot of 95 that has a light eye. Not a male that has a neck hackle any lighter than the rest of him. Said Dan Lambert, old breeder and one-time judge of Barred Rocks at New York: "I never expected to see such Barred Plymouth Rocks." Said M. F. Delano: "Thompson's ten pens are the greatest things ever produced by any breeder of any variety." Said Newton Cosh, who judged the class this year: "Among the 1st, 2d and 3d pullets it didn't matter much which won. It depended a good deal on the time of day in which they were judged. And after showing these wonderful pullets in the single class, he has four pullets in his 1st pen, any one of which would win 1st in any other showroom in America. I have judged Barred Rock meets in sixteen different states this year, and know." Said a judge who handled this class at New York for some years: "While the pullets in the 1st prize pen are wonderful, it looks to me as if the females in the 2d young pen were even better."

It would be hard to exaggerate on the quality of these birds. It is hard enough to find words that will do them justice. And they are not the product of luck! Said Valentine Thompson, who is gradually filling his father's shoes as the breeder and exhibitor of this wonderful line: "Our 1st cock this year is the son of our 1st prize cock in 1919. There is no luck about that. These birds come good because the breeding is behind them."

There was a cockerel not shown by Thompson that Newt Cosh pointed out and said: "There is a bird that would win in any other show in this country, but I couldn't place him in this competition." If anyone thinks that because Thompson wins the prizes at New York there is no competition, let him enter his flock and he will have all the competition that he wants.

Thompson always comes with a few surplus birds more than he has entered. If a bird should die or an accident happen, he is prepared. When the judging starts, these dozen or fifteen extra birds go home. Several years ago a pen went home that was not needed for New York. A prominent breeder saw this pen, bought it for Boston, and not only won 1st, but the male heading it won the championship for the best Barred Rock male at Boston.

The 1st cock at New York this year had a strong head, rich yellow shanks, strength of barring all the way down, broad back and finished tail. After putting the tail on this chicken, Nature hung two long streamers below his tail that added a touch of distinctiveness to him. This bird has as much black in his dark bar as any chicken in the show; it was his clear white bar that gave him his clear color. Second cock, about as good head as you can get; great on wing bow;

L. L. HUSTON

200 Harrison Street

Oak Park, Ill.

not as well finished in tail as 1st. If you would mix up the 4th and the 1st, you could hardly tell them apart. "The four greatest cocks ever shown by one man," said Cosh. All had big, strong heads, broad bodies, good structure.

"First to 3d hens about a toss-up," said the judge. "First was a little more evenly spaced all over. I go for this uniform barring. The Standard calls for it. Second hen has a blue tone of color. I like that. She has wonderful underbarring, good shape, and rings all over. Third, close up. It doesn't matter much which won. It depends a little on the light in the Garden." First was the most evenly barred hen we ever saw. Spacing over shoulder and cape of back usually runs a little wide, but this hen was uniformly barred all over. Add to this hen wonderful breast development, ideal shape of back, good comb and yellow shanks. These are fine points, but a judge has to get down pretty fine in deciding between such hens as faced him in this class. From 1st to 5th they were big hens; they were Plymouth Rocks. As for the rings of barring, anyone could see them; they did not need to be pointed out.

"I think 1st cockerel," said Cosh, "is the most beautifully barred chicken I ever saw. Wonderful blending of hackle. Yet, I would have been justified in changing 1st and 2d. A man can say that he 'prefers' one or the other. I divided the honors between them, giving color special to the 1st and shape special to the 2d. One thing is worthy of note: both this year and last year I have been able to place from 1st to 5th, cockerels that have absolutely the same tone of color. The 4th and 5th cockerels are like peas in a pod. If I had had more ribbons I would have had to keep right on placing the fifteen cockerels that Thompson is showing.

"In pullets I never judged five as nearly alike. First one has the same kind of barring right around; good color inside and out. There is nothing you can add to her. Description of the 1st will suit the 2d. Here is 3d pullet, same kind in every way. Turn these pullets around as you will, you can get only one shade of color in them." There is breeding in these chickens. They have barred wings and clean-cut straight bars across their tails. They have nice long backs, gorgeous underbarring, and soft texture of feather.

First young pen the greatest of all pens that have ever been exhibited. "Take out any pullet in it and put her in the single class in any other show in America and she would win 1st," said Cosh. Breast of male matches pullets. Well finished male. Right shade of color; do not want male too narrow barred to put in pen and match. Second pen same thing over again. As one pullet sat on the shavings in this pen the light caught her tail and tail coverts. No artist could have painted anything like it, for he might have got the bars right, but he could not have blended his oils to make the tone of color.

White Plymouth Rocks—L. C. Bonfoey, Deep River, Conn., 1 cock, 2 hen, 4 ckl, 1 pl, 2 young pen; Brookside Farms, Great Barrington, Mass., 3 cock; Owen Farms, Vineyard Haven, Mass., 2-4-5 cock, 1 ckl, 2-3-4 pl, 1-2 old pen, 1-3 young pen; Wilfred E. Erwin, 4 hen; Horace N. White, Media, Pa., 3 hen; Wilburtha Poultry Farm, Trenton Jet., N. J., 1-5 hen, 2 ckl, 3-5 old pen, 4-5 young pen; Charles A. Schmaling, Port Chester, N. Y., 5 ckl; R. S. Chalker, Higgenum, Conn., 3 ckl; William H. Rogers, Chango, N. Y., 5 pl; Alfred J. Tipping, Englewood, N. J., 4 old pen.

Twenty-three cocks, 31 hens, 41 cockerels, 31 pullets.

First cock, nice head, good back, white, proper spread of tail. First Boston cock stood alongside, winning 3d; slightly higher in tail and slightly shorter than 1st New York bird. Second cock, on order of 1st; big, long bird; good head, back and tail.

First hen, very smooth; wonderful lines; a hen hard to fault. Second hen sets lower on hocks and has more fluff than 1st.

First cockerel, greatest White Plymouth Rock ever seen in the Garden. The lines and finish of this bird are unsurpassed. Second cockerel looked like winners until 1st came in. Second, same type of bird, but beat on finish of tail. Third, another good one.

First pullet, fine head, legs; elegant condition. A good one.

Second pullet, pretty much same condition and hard feather; not quite as good underline.

Buff Plymouth Rocks—Thames View Farm, New London, Conn., 4 cock, 5 hen, 4 ckl, 1-3 pl; Daniel S. Riker, New York City, 1 cock, 2-3 hen, 1-5 ckl, 1 old pen; James H. Vincent, Hazelton, Pa., 2 cock, 2 ckl, 4 pl, 3

Ratz Arconas

Dominate at

MADISON SQUARE GARDEN

January, 1921

In the greatest class in the history of the breed at the world's leading show, we win sixteen places on eighteen entries.

WINNING

Single Combs

Cockerels—1st and 2d.
Pullets—5th.
Cocks—3d.
Hens—1st and 4th.
Old Pen—3rd.
Young Pen—4th.
Best Shape Male.

Rose Combs

Cocks—2d.
Hens—3d and 5th.
Cockerels—4th.
Pullets—1st and 4th.
Old Pen—2d.
Young Pen—2d.
Best Color Male.

Every Bird Bred on Our Farm

Eggs for hatching from pens headed by our Madison Square winners. Free—Catalog and price list.

G. & W. RATZ
TAVISTOCK, ONT.

old pen; Howard Brown, Coatesville, Pa., 5 cock; Freier & Lukens, Meriden, Conn., 3 cock, 4 hen; Kingman Farm, Randolph, Mass., 1 hen, 2 old pen, 1 young pen; Boys' & Girls' Poultry Club, West Raleigh, N. C., 3 ckl, 5 pl; Edward E. Minard, Lorain, O., 2 pl; Galvin Farm, Elmhurst, L. I., N. Y., 2 young pen.

Thirteen cocks, 13 hens, 13 cockerels, 15 pullets.

First cock, better balanced on legs than 2d. Both birds of good substance. First a shade lighter. Second had a beautiful sheet of golden buff, one shade over his top; no chestnut in tail, although a little black flecking in main tail feathers underneath.

First and 2d hens a strong team. First especially smooth in feathers and of same soft, even color from end to end and top to bottom. Second not quite as even.

First cockerel's tail needs more time for development; comb a shade heavy; slight in breast; good back and balance on legs. Second, a nice big cockerel of good quality. Third cockerel won by Boys' & Girls' Club of South Carolina.

First pullet, nice shape, not equal of 1st hen in soft, level color. Second pullet of same good type, smooth color, little short in wing development.

Silver Penciled Plymouth Rocks—Monroe Bros., Monticello, N. Y., 1 cock, 1 hen; Clyde H. Swan, 1-2 ckl, 1 pl.

First cock, good type. Would like a pound more of weight; sound breast, silvery top free from brass. Would like sounder saddle striping. First cockerel better striped bird; shows little red in wing bar; a little light flecking in breast. First hen, big, well penciled. First pullet has excellent Plymouth Rock type.

Partridge Plymouth Rocks—Bird Bros., Myersdale, Pa., 1-2-3-4-5 cock, 2-3-5 hen, 1-3-4 ckl, 1-3-4 pl, 1 old pen, 1 young pen; O. H. Hostetter, Hanover, Pa., 1-4 hen, 5 ckl, 2 pl; Monroe Bros., Monticello, N. Y., 2 ckl; Thomas O. Maxfield, Broomfield, N. J., 5 pl; Mrs. S. Hartshorn, Short Hills, N. J., 2 young pen.

Six cocks, 11 hens, 8 cockerels, 9 pullets.

First cock, good size, true Rock back and tail; proper station; a most remarkable and beautiful shade of ground color; one level tone of red, matching over hackle, wing bows, back and saddle as well as any male ever shown. A velvety black stripe in neck and back. A little red flecking in lower breast. Hackle clear of any black on edges. First hen, clearly penciled; feathers small and lines are fine; beautiful shade of ground color. Hackle penciled. The best colored Partridge Rock hen we have seen in the Garden. Second hen, big, larger feather; hackle runs light half way down.

First cockerel, smaller than usually wins here. First cock spoiled us to look so soon on any other males. Best cockerel was shown by Bird and was not placed. An "S" marked on coop tag suggested that he might have been thrown out for a stub. Even old hands never become sure shots.

First pullet, best penciled pullet that has been shown. Markings on back as far as tail, lower breast and fluff, equal to a good hen. This pullet has a good head and true Rock type. Second pullet, another good one, of similar type and quality, and any other year would have been 1st.

Columbian Plymouth Rocks—Miss Elsie O. Hincken, Brooklyn, N. Y., 5 cock; Henry L. Wilbur, Tiverton, R. I., 1-2-3 cock, 2-5 hen, 1-2-3-4 ckl, 1-4-5 pl, 1 old pen, 1 young pen; J. M. Jones, Hornerstown, N. J., 4 cock, 3-4 hen, 5 ckl, 3 pl; T. J. Enslin, Hackettstown, N. J., 1 hen; Albert C. Ballinger, Newark, N. J., 2 pl.

Ten cocks, 15 hens, 15 cockerels, 19 pullets.

Columbian Rocks, 1st cock winner of 1st at Boston. First hen good in black points, a little heavy in comb and short in back. Second hen, better comb, eye and back, and good Light Brahma markings. First and 2d cockerels, good type and clear hackle striping, free from smut on edges. First and 2d pullets, big, long bodied, white bodied birds; good in black markings, and very attractive.

R. C. Barred Plymouth Rocks—S. B. Wenger, South English, Iowa, 1 cock, 1 hen, 1 ckl, 2 pl; J. I. Niswander, South English, Iowa, 4 cock, 2 hen, 5 ckl, 1 pl; Isaac Green, Pemberton, Ohio, 3 cock, 4 hen, 2-3 ckl, 3 pl; Fred L. Seager, Rudolph, N. Y., 2 cock, 3 hen, 4 ckl, 5 pl; Rev. W. S. Hoke, Monticello, Ill., 4 pl.

Silver Wyandottes—F. H. Davey, Vineyard Haven, Mass., 2 cock, 2-3 hen, 1 ckl, 1-4 pl, 1 old pen, 1 young pen; R. G. Williams, Barre, Mass., 1-4 cock, 1-5 hen, 2-3 ckl, 2-3-5 pl; James F. Hughes, Peekskill, N. Y., 5 cock; Eugene Sites, Elyria, O., 3 cock; M. R.

SELF-LOCKING CARTONS

Gives safety from breakage whether you supply a local trade or ship by parcel post, freight or express. NOT ONLY safety—you will have a quality package that makes your customers egg hungry.

Try a small lot. Send \$1.75, postage extra, for 100 stock printed cartons, labeled "Extra Selected Eggs" or "Quality Breakfast Eggs" (shipping weight 14 pounds). If you do not find the cartons the best you have ever used, we will return your money.

Write for prices on quantities of 1,000 or over printed with your farm name or brand name.

Self-Locking Carton Co.
436-438 East Illinois St., Chicago, Ill.

Note the Large Glass Top.

The old, well-known name, "Close-to-Nature" is a guarantee of a safe, sound sensible incubator.

INCUBATORS AND BROODERS

Not made impracticable by a multitude of "special features" which only add expense without efficiency. Easily operated, and responds so quickly to the thermostat that there is no over-heating of eggs; for you know an over-heated egg means a weak, crippled, or a dead chick. Warm water heat, double walled construction, and large glass top that enables a view of the entire egg chamber without opening the doors. Made in five sizes from 60 to 300 eggs. Write for full information.

OPEN AIR HOVERS AND BROODERS
Apply the three "Close-to-Nature" principles: Contact warmth like the hen; fresh air ventilation, not hot air; no piling up or overcrowding. Nothing now advertised like these brooders and hovers—highly successful, and as natural as Nature itself.

Morris White Orpingtons Are Absolutely Supreme

SUPREME in Standard exhibition qualities; **SUPREME** at America's greatest shows, year after year, in strongest competition; **SUPREME** in high egg production; **SUPREME** as a combination of highest exhibition values and the ability to produce the most eggs per fowl the year 'round.

World's Largest White Orpington Farm

Pardon, Reader, the strong character of the words here used by us, but we have worked faithfully for a long period of years to reach the position of leadership now occupied beyond question by the Morris "Proven Leaders" strain of White Orpingtons and therefore we feel entitled to state the **FACTS** about them. To date they not only are all that we here claim for them, but there are three other facts you should know, on account of their special interest to you: First, we breed, each season, every bird shown by us; second, these birds are produced by us on the largest exclusive White Orpington farm in the whole world—largest by at least three to one; third, our strain is now the dependable source each season of the "Proven Leaders" shown with uniform success **BY OUR MANY CUSTOMERS** throughout the United States and Canada.

Triumphs of 1920 and 1921

The Morris "Proven Leaders" strain of White Orpingtons won **NINE FIRST PRIZES** out of a possible twelve this season at America's two premier winter shows, as follows:

Chicago Coliseum

Chicago, December 1-6, 1920

Cocks	1st, 2d, 3rd
Cockerels	1st, 2d, 3rd
Hens	1st, 2d, 5th
Pullets	1st, 2d, 4th
Old pens	1st, 3d, 4th
Young pens	1st, 3d, 4th

Best display and numerous specials.

Madison Square Garden

New York City, Jan. 18-22, 1921

Cocks	1st and 2nd
Cockerels	5th
Hens	4th
Pullets	1st and 4th
Old pens	1st
Young pens	3rd

Shape special and color special for best male on first cock.

Quality—Size—Vigor—Layers

"Proven Leader" White Orpingtons are snow white in plumage, beautiful in appearance, are great winter layers and superior as table fowl meat. We breed White Orpingtons that positively combine in the same birds sensational winners in the show room and sensational layers in egg-laying contests—have been winners time and again of highest honors at New York, Chicago, Memphis, Detroit, Kansas City, Cincinnati, etc., capturing repeatedly more points at largest shows than all our competitors combined. For example, we bred and raised the first cockerel at Madison Square Garden in 1914, 1915, 1916, 1917, 1918, 1919, and 1920. Our remarkable hen, "Pauline," was in the first prize exhibition pen at the Chicago Coliseum Show, 1920, also in the first prize old pen at Madison Square Garden, 1921, proving again that highest exhibition quality stock in White Orpingtons can also be high egg producers.

Egg Laying Records in Official Contests

Here are sample egg records of actual blue ribbon "Proven Leader" winners, produced by us, as made in official contests:

PRINCESS PAT	303 eggs per year
PAULINE	245 eggs per year
PEGGY	241 eggs per year
POLLY	226 eggs per year

Single Birds—Breeding Pens—Eggs—Baby Chicks

FOR SALE IN SEASON, single birds and breeding pens, also hatching eggs and baby chicks. We make a specialty of baby chicks because in this case the purchaser knows just how many chicks he is to get for the amount paid. Breeding stock carefully and expertly mated on request and we invite **YOU**, reader, to adopt our blood lines. Latest illustrated catalog and mating list will be sent free on request, giving further information. Address

First cock, Madison Square Garden, Jan. 18-22, 1921.

HALL

The is no chick like a HALL chick

Millions of HALL chicks will be hatched in America this season. By the hundreds of thousands they will be hatched in England, Russia, Germany, Australia, South America, Austria, Mexico.

The HALL girdles the globe because business poultrymen everywhere recognize the fact that the true value of an incubator is determined by the number and quality of chicks it turns off.

If you cannot buy a HALL Incubator this season buy HALL hatched chicks. The result will prove the wisdom of your judgment.

More than 25 years world wide service supports this statement.

"HALL EQUIPMENT," a valuable and helpful book written by HALL experts, will be sent upon request.

BABY CHICKS AND EGGS

From our twenty breeds, including ducklings. Send for 56-page catalog showing everything needed for poultry keeping, with prices and full information.

The Mammoth Hatchery, Inc. Box 1401 R.F.D.1 GLEN ELLYN, ILL.

Croman, Trumbauersville, Pa., 4 hen; W. E. Samson, Kirkwood, N. Y., 4-5 ckl.

Eight cocks, 11 hens, 14 cockerels, 11 pullets.

First cock, elegant neck and back striping, good head and type; little frosting on breast. Second, another strong bird, breast free from frosting, back color smudgy on tips of feathers. A wonderful team of cocks. First hen, splendid Wyandotte type, open lacing. Second hen, little larger, not as good in tail coverts. Same beautiful open lacing with big round centers. First cockerel, wonderful breast and fluff lacing, good striping on top, good type. Second cockerel, better comb, silvery white top and good striping, not as good in breast. First pullet, a wonderful coat of laced feathers which more than make up for the fact that she is a trifle long and tight in tail. Second pullet, a trifle heavier black lace. Third pullet was 1st at Boston. A hairline of frosting on back.

Golden Wyandottes—E. C. Belton, Mt. Airy, N. C., 2 cock; Melvin F. Uphoff, Bound Brook, N. J., 1-3-4 cock, 3-4 hen, 1-3 ckl, 1 old pen; B. F. Kaupp, West Raleigh, N. C., 1 hen; Frank Ward, Tiffin, Ohio, 2 hen, 5 ckl, 1 young pen; Frank P. Seaman, Mineola, N. Y., 4 ckl; William Schmidt, Canaan, Conn., 2 ckl.

Four cocks, 4 hens, 7 cockerels, 7 pullets.

First cock, excellent breast and fluff lacing, good Wyandotte back and tail. Wing bow completely laced. One shade of rich ground color over top. Open center in saddle. Red quill in hackle. Under color slate or red, free from white. First hen, big, not as rich in ground color as appears to be the growing demand. Second hen, small, rich ground color, practically black tail coverts. Dark coverts are possible in the Golden, and will simplify the problem 50 percent. Do not compare with the Silver Laced Wyandottes. Study the tails of the Golden Spangled Hamburgs in relation to the tails of the Silver Spangled. Third, a wonderful big hen, not as good in ground color and runs out in breast lacing. Description of 1st cock answers for 1st cockerel. First pullet, of good type, nice ground color and lacing.

White Wyandottes—C. W. Diggle, Plainville, Conn., 3 cock, 5 hen, 1-5 pl, 1 old pen, 2 young pen; O. P. Keator, Cortland, N. Y., 4 cock, 1 hen, 4 pl; E. B. Underhill, Poughkeepsie, N. Y., 5 cock, 5 ckl; Charles Nixon, Washington, N. J., 2 cock, 3-4 hen, 3 pl, 1 young pen; A. J. Fell, Lansdale, Pa., 1 cock, 2 hen, 2 pullet; C. P. Davis, New Brunswick, N. J., 1 ckl; T. A. Havemeyer, Mahwah, N. J., 2-3-4 ckl; H. M. Freas, Fort Washington, Pa., 2 old pen; A. H. Faulkner, Millington, N. J., 4 young pen; A. W. Hewitt, Windsor, Conn., 3 young pen; Percy J. Smith, Middletown, N. Y., 5 young pen.

Twenty-three cocks, 30 hens, 40 cockerels, 36 pullets.

First cock, good comb, red eye, good head and legs. A well modeled bird, well finished and shown in good condition. Silvery white feather that is smooth. Saddle is broad and does not pinch in. Second cock, of same type and quality; not quite as well finished in tail. When a judge chooses between such cocks, he gets down to very fine points of detail. First hen, good head, and attractive bird; little loose in breast feathers. Second hen, a grand female, very white and smooth; trifle heavy in fluff. Third hen, pretty much same type as 2d. Fourth, very smooth feathered hen. If you could put comb of 1st hen on her, she would give 2d hen a close run. Some might say that 4th hen is a little short, but she is as smooth as a pullet. Little heavy in comb.

First cockerel carries himself well at all times; not a fine modeled bird, but carries himself without shaping. Second has wonderful head, not quite finished in tail. Third carries good type, has nice length and carriage of tail, but coverts not developed. Fifth, an attractive chicken; a shade coarse, but failed to land higher on account of color. Fourth, a younger chicken.

First pullet, very white; smooth feathered, but shows some ridges over cushion; good head. Second has head and type; good back and breast; well balanced on legs; cushion over tail did not wash out quite smooth. Third pullet, good head, and smooth, hard feather; one bad hind toe. First young pen contained four splendid females and a good cockerel.

Black Wyandottes—Ralph Roubesh, Arcadia, Ind., 2-3 cock, 1-2-3 hen, 4-5 ckl, 1-4-5 pl, 1 old pen, 1 young pen; R. E. Hickman, Girdletree, Md., 1 cock; C. H. Nesbitt, Riverhead, L. I., N. Y., 4 hen, 1 ckl, 3 pl; Eugene Sites, Elyria, Ohio, 5 hen, 2-3 ckl; Bradley Cook, Oley, Pa., 2 pl.

Three cocks, 7 hens, 5 cockerels, 5 pullets.

OWEN FARMS

S. C. White Leghorns

Stand Pre-eminent

THEIR position has been established thro crashing victories at Madison Square Garden, New York, Boston and the Great New York State Fair. By wonderful winnings in the hands of customers all over the country. By great egg records in the trap-nests of customers.

1st, 2nd, 3rd, 4th and 5th cockerel have been won by Owen Farms Leghorns at one showing at Madison Square Garden, New York.

MAURICE F. DELANO, Owner

MY 1921 Garden Exhibit consisted of the finest team that ever entered the Garden, *and a great winning was made.* Owing to the break down of motor trucks, my Garden exhibit was out doors for ten hours the coldest night and morning this winter. Frosting of the combs prevented the sweeping victory that the string deserved, but even with this handicap Owen Farms Leghorns won over First Cock, Fifth Cockerel, Fourth and Fifth Pullet, Second and Fifth Old Pen, First and Third Young Pen, and were the admiration of every exhibitor and visitor.

Our 1921 Leghorn Matings

ARE FAR AND AWAY THE FINEST EVER MADE and YOU can secure eggs for hatching from my FINEST BIRDS including five First Prize Garden males and INSURE RAISING WINNING CHICKS. My mating list will give you the entire story.

Breeding Birds for Sale

Have the finest cocks, hens, cockerels and pullets that Owen Farms ever sold. If you are in earnest and want the finest birds obtainable with the finest blood lines behind them write your exact wants and you will find them here at a price you will gladly pay. Have never had the number of choice birds from which to choose that you will find here now.

THE BEST WHITE LEGHORNS IN AMERICA are HERE ON OWEN FARMS. IF YOU WANT THE BEST, YOU CAN GET THEM HERE. Have splendid males and very choice females for sale as breeders. Will mate them expertly on world's best blood lines and this will START YOU RIGHT in this great egg-yield breed, including highest exhibition values.

OWEN FARMS

Office at 107 WILLIAM STREET
VINEYARD HAVEN, MASS.

MAURICE F. DELANO, Owner

Hatch Husky Chicks— Raise ALL of Them

YOU can do this. And it means big profits—*sure*. In the past you may have had poor hatches of weak chicks and heavy losses during the brooding season. Drop the old, inefficient ways. Adopt those of today—the day of progressive methods.

Start *right*. Husky, healthy chicks come only from strong, vigorous breeding flocks. So begin *now* to put your breeders in tip-top condition. Just add to their ration a small quantity of America's original and standard poultry tonic and conditioner—

Pratts Poultry Regulator

Then watch the results. More eggs—higher fertility—bigger hatches—better chicks. In short, by investing a few cents to test "the Pratt way" you will get results that will later mean dollars of extra poultry profits. You will be satisfied—you must be. If not, "your money back."

And when your chicks are hatched, *raise them all*. Grow them strong and vigorous to early, profitable maturity. The food you give them is most important. This problem is solved by using the original "baby food for baby chicks"—

Pratts Buttermilk Baby Chick Food

Thousands of successful poultrymen will tell you so. In fact, many of them date their success from the time they began using this perfect chick ration.

The original Pratts is slightly higher in price than the imitations, but it is the cheapest chick food on the market when measured by *results*—by the number, size and quality of chicks grown. It actually pays for itself in the value of chicks saved—the extra chicks you would otherwise lose.

Pratts Buttermilk Baby Chick Food contains in correct proportion the food elements required to fully nourish every part of the chick, to grow bone, muscle and feather. Easily and quickly digested, it helps to prevent deadly bowel troubles. Plenty of the finest buttermilk, in powdered form, gives the food great tonic properties.

Let your first brood of chicks show you just how good Pratts Buttermilk Baby Chick Food is. The result will astonish you. If not, no cost to you.

**"Your Money Back If
YOU Are Not Satisfied."**

Get the Genuine Pratts. Refuse substitutes.

523 Plymouth Court, Chicago, Illinois

Successful Poultry Culture

Treats on all subjects appertaining to the poultry business. The chapter telling how to save three-fourths of your feed bills is alone worth many times the price of the book. 128 pages, profusely illustrated. Price 50 cents.
American Poultry Journal Pub. Co.
523 Plymouth Court, Chicago, Illinois

More Black Wyandottes than usual. First pullet the star of the class.

Buff Wyandottes—G. Arthur Cook, East-hampton, Mass., 2 cock, 1-2-4 hen, 1-2-3 ckl, 2-3 pl, 2-3 old pen, 1-3 young pen; S. A. Howland, Granville, N. Y., 1 cock, 3-5 hen, 5 ckl; George M. Bell, Voorheesville, N. Y., 3-4 cock; Elmpines Farm, New Rochelle, N. Y., 5 cock, 4 ckl, 1-4-5 pl, 1-4 old pen, 2-5 young pen; Huston Bros., Hanover, Pa., 4 young pen.

Twelve cocks, 13 hens, 13 cockerels, 13 pullets.

A strong class of cocks; some better than others, the tops being of superior Wyandotte type and lustrous golden color. Males not of even color, all sections blending into a harmonious whole, have little chance in this competition. First hen, a very large Wyandotte and of even, soft, buff color. First cockerel an outstanding bird; as wonderful a buff tail as was ever carried by any buff bird. Second cockerel another bird of good substance and good color. Pullets as a whole showed good type and soft, level color. There is breeding back of such chickens and careful selection for the show. These pullets show that the breeders are again progressing. All hands were glad to see Judge L. D. Howell after his long and serious illness.

Partridge Wyandottes—Buck Bros., Oxford, Mass., 5 cock, 2-3-4 ckl, 5 pl, 2 young pen; Sheffield Farms, Glendale, Ohio, 2-3 cock, 1-3-5 hen, 1-2 pl, 1 old pen, 1 young pen; Sunbrier Farms, Detroit, Mich., 4 cock, 4 hen, 1 ckl, 2-3-4 old pen, 3-4 young pen; William R. Mollineaux, Jr., Hempstead, N. Y., 1 cock, 2 hen, 5 ckl, 3-4 pl.

Eight cocks, 13 hens, 12 cockerels, 12 pullets.

First cock, attractive bird in the coop, but fails in striping in saddle hangers; some red in breast. Second, larger bird; better back striping. First hen, wonderful penciling all over; nice shade of ground color. Second hen excels in type; darker shanks; black penciling a trifle heavier than 1st.

First cockerel, an exceptional bird; elegant head and true Wyandotte back and tail; bright shade of red top color, and as perfect saddle striping as grows. Second cockerel, on same general order; not as broad a back; narrow comb. First pullet, good type, and good penciling for a pullet. Second pullet not as good in breast penciling; younger.

Columbian Wyandottes—Wilkinson & Wil-kinson, Blairsville, Pa., 1 cock, 4 hen, 1 ckl, 2 pl; Henry W. Polgreen, Albany, N. Y., 5 cock, 5 ckl, 3 pl; Austin G. Warner, Whitesboro, N. Y., 3 cock; George Lyman Hall, Dudley, Mass., 2 cock, 5 hen, 3 ckl, 1 pl; Levi A. Ayers, Granville, N. Y., 4 cock, 3 hen, 4 ckl, 4 pl, 1 old pen, 2 yearling pen; Mrs. R. G. Chattin, Westfield, N. J., 1-2 hen, 3 yearling pen; Arthur A. Stevens, Goshen, N. Y., 2 ckl; James S. Thomson, Kensington, Conn., 5 pl; S. S. Newton, Ballston Spa, N. Y., 1 yearling pen.

Nine cockerels, 9 hens, 11 cockerels, 7 pullets. First cock, a clean colored fellow, nicely striped; good wings; nice bodied bird; little tight in tail. First hen has pretty much the quality of a pullet; an outstanding individual. First cockerel, broad in comb and tight in tail, white body and nicely striped. Second cockerel, not as full lines as 1st; good color. First and 2d pullets good, and made close competition. Second trifle short in main tail feathers which, with two weeks' growth, will help her to outgrow her present cobby appearance.

Black Java—Thos. L. Shere, 2-3 cock, 1-3 hen, 1-2 ckl, 1-2 pl; C. R. Valentine, 1 cock, 2 hen.

A nice showing. Typical Java shape throughout.

Dominique—Thurlow Travis, Brooklyn, N. Y., 1 cock, 1 pl.

S. C. Rhode Island Red—Prospect Farm, Newark, N. J., 1-3 cock, 1 hen, 2 ckl, 1-3 pl, 2 old pen, 1-2 yearling pen; Rev. C. T. McCann, Manchester, Conn., 5 cock, 4 pl; H. E. Watts, Monument Beach, Mass., 2-4 cock, 3 hen, 1-5 ckl, 5 pl, 3 yearling pen; D. McL. Quackenbush, Darien, Conn., 2 hen, 1 old pen; F. W. C. Almy, Tiverton 4 Corners, R. I., 4 hen; Lester Tompkins, Concord, Mass., 5 hen, 3 ckl, 2 pl; John B. Hendrickson, Ridgewood, N. J., 4 ckl, 3 old pen, 5 yearling pen; D. G. Coffman, Josephine, Tex., 5 old pen; Wilburtha Poultry Farm, 4 old pen; Arthur S. Bailey, Cobalt, Conn., 4 yearling pen.

Twenty-four cocks, 22 hens, 37 cockerels, 32 pullets.

First cock was 1st cockerel last year. A little more thigh and the bird would be a model. Second cock, another big bodied bird. Has better station than 1st, but does not carry width of back to tail as well as 1st. Second cock was 1st at Boston. First hen

Robadel Orpingtons are better than ever

At the Great Madison Square Garden
Poultry Show January 18th to 22nd, 1921

Robadel White Orpingtons

for the third consecutive time win *best display*,
also color and shape special on their wonderful
first prize hen "Miss Robadel."

Robadel Black Orpingtons

won best display, winning 5 out of 6 firsts.

Robadel Buff Orpingtons

won 3rd pullet, 5th hen, 4th and 5th young pen.
These winnings demonstrate conclusively that
Robadel Orpingtons are the three greatest flocks
of Orpingtons on any one farm in America.

We Do Not Sell Baby Chicks or Hatching Eggs

We are in a position to supply
foundation stock that will re-
produce the kind of stock you
are looking for, either for ex-
hibition or general purposes.

If you are interested in Orping-
tons, write us.

*Every Robadel sale is made on an
absolutely satisfaction guaranteed
basis.*

I positively guarantee that if
you will purchase a copy of
"Hubbard's Poultry Secrets"
and a pair, trio, or breeding pen
of Robadel Orpingtons and fol-
low the instructions in Hub-
bard's Book of Poultry Secrets,
that you will succeed in pro-
ducing birds of a higher quality
than can be obtained in any
other way.

Robadel Poultry Farm

Cos Cob, Connecticut

A. C. Robertson, Owner

Chas. Hubbard, Manager

stands little higher than majority of hens, long body, and legs came out of center of body, giving good balance and flat back. Good tail. Second hen, same station as 1st; not as level in back. First cockerel, considerable station. Bird lacks length of underline. Second cockerel, a smooth feathered bird; spread tail: an active type; not quite as much oblong shape as this farm's 1st cockerel of last year. Third cockerel, splendid type over neck, back and tail; good head; could be a trifle fuller in breast. Fourth cockerel, a bigger bird than first three; like third in breast. First pullet a good one; not an easy one to fault in either shape or color. Second, a larger and older pullet; heavier bone and comb; looks like she was laying. Third on same order as 1st. Fourth fails in comb.

Reds are judged on basis of both shape and color. Shape, however, is specific; the Standard describes but one shape for the breed, and we have discussed these birds from the standpoint of type. The judge of the Single Combs did not emphasize type as much as did the judge of the Rose Comb Reds.

R. C. Rhode Island Reds—F. W. C. Almy, 4 cock; F. H. Stillwagen, Allentown, Pa., 1-2 cock, 3-5 hen, 2-3 ckl, 1-3-5 pl, 2 old pen, 1 yearling pen; Lester Tompkins, 3-5 cock, 4 hen, 4 ckl, 2-4 pl, 2 yearling pen; Geo. W. Tracy, Kinderhook, N. Y., 2 hen, 1 ckl, 1-3 old pen, 3 yearling pen; Scranton Red Farm, Scranton, Iowa, 1 hen; A. L. Briggs, Ashawa, R. I., 5 ckl; Michael Coffey, Omaha, Neb., 4 old pen; John V. Vanderloef, Montgomery, N. Y., 5 old pen.

Thirteen cocks, 12 hens, 19 cockerels, 11 pullets.

A much larger and better class of Rose Combs than last year.

First cock, big. Both 1st and 2d excellent in head, including neat comb. These birds are well finished and of good type. Third fails in comb; big, long backed, upstanding cock; shy in breast and tail. First hen of good substance; well balanced on legs; good depth of breast; nice back line with good width. Second, another good bodied matron, but not quite the same natural style of 1st. Third

hen, long and level in back. A great improvement in Rose Comb Reds over last year.

First Rose Comb cockerel has breast and body, level back, correct station; tail not finished; comb terminates in three spikes. Second, another good cockerel; good back and body; better finished tail than 1st; pebbling on comb coarse and high. Third cockerel, smooth comb and more cobby than other two. First pullet big and long; good depth of breast and bod neat comb. Second pullet, good head, not as flat in back over cushion as winner. Type was considered more by judge of Rose Combs than by the judge of the Single Combs.

R. C. Rhode Island White—Robt. Stewart, Jr., Ossining, N. Y., 1 cock, 2 hen, 2 ckl, 1 pl; F. W. Cumpstone, 2 cock, 1 hen, 1 ckl, 2 pl.

S. C. Rhode Island White—F. W. Cumpstone, Waterford, Conn., 1 cock, 1 hen, 1 ckl, 2 pl; Harley E. Caldwell, Canutillo, Tex., 2 hen, 4 ckl, 1 pl; H. H. Metcalf, Hudson, Mass., 3 hen, 2-3 ckl, 3 pl; Lyle M. Gifford, Oneonta, N. Y., 4 hen; Paul E. Vrancik, Trenton, N. J., 5 ckl.

Second Rose Comb pullet, typical Rhode Island type. Make her red and she would win in the Rhode Island Red class. This pullet is not a Wyandotte; neither is she a Rock. First and 2d Single Comb Rhode Island White cockerels look like Rocks.

Buckeye—Miss Genevieve Trevorah, Cornwall, N. Y., 1 hen, 1 ckl.

An excellent pair of Buckeyes. Have not seen the equal of this female.

Jersey Black Giant—Thos. H. Mettler, East Millstone, N. J., 2 cock; Marcy Farms, Matawan, N. J., 1-3 cock, 1-2-4 hen, 1-3-4 ckl, 2-4-5 pl; Dexter P. Upham, Belmar, N. J., 3-5 hen, 2-5 ckl, 3 pl, 3 yearling pen; Groton Place, Lenox, Mass., 1 pl; Chas. G. Urskel, Trenton, N. J., 2 yearling pen; Wilburtha Poultry Farms, 1 yearling pen.

Four cocks, 14 hens, 15 cockerels, 18 pullets.

First cock, big body, well set on strong legs; long back and keel. First hen, big, good sheen. Second hen, big, long back; legs

come out behind center of body. First pullet on order of 1st hen. Wilburtha Farm has taken up, Black Giants.

ASIATICS.

Light Brahma—Harvey C. Wood, Bound Brook, N. J., 2-4 cock, 1-5 hen, 1-2-5 ckl, 1-4-5 pl, 2-3 old pen, 1-4 yearling pen; C. W. Everitt, Huntington, N. Y., 1 cock, 2-4 hen, 4 ckl, 2 pl, 1-4 old pen, 2 yearling pen; Belch & Brown, Manchester, Conn., 3-5 cock, 3 hen, 3 ckl, 3 pl, 5 yearling pen; August Geiger, Hastings-on-Hudson, N. Y., 3 yearling. Nine cocks, 14 hens, 17 cockerels, 16 pullets.

First cock, good Brahma type; plumage well grown; broad feather in hackle; elegant striping in front of hackle as well as down through the long neck feathers that spread from shoulder to shoulder. Second cock fails to win in comb and wealth of hackle. First hen, a true Brahma in every particular; white body; good neck, wings and tail. Second, on same order but not as clean in back. Third hen, clean lines, not quite as intense a black. Fourth, Cochiny.

First cockerel, clean, white body, strong, clean hackle; good type; good head and tail. Fifth cockerel same kind of a chicken, but darker; slate shows in fluff; black in saddle is more intense. If 2d cockerel had feathering on middle toes, he would stand out as the sensational bird of the year. Third cockerel, looks light on surface, and is a big surprise when hackle is opened up. Fourth cockerel has a longer back and lacks breadth of others. First pullet as big as a hen. Strong neck, tail and wings; clean, white back, breast and fluff. Second pullet, clean cut, not as large as winner. Third pullet, beautiful back and tail. Too fine in skull for Brahma.

Dark Brahma—Henry O. Havemeyer, Mahwah, N. J., 1-3 cock, 3-5 hen, 1 ckl, 1 pl, 1 yearling pen; Dr. S. Lott, Waterloo, N. Y., 2 cock, 1 hen, 2 ckl, 2 pl; Aug. Sonneman, Jr., York, Pa., 4 cock, 2-4 hen, 3-4 pl.

First cock, blind in one eye. First hen, big and well penciled. First cockerel wins

SUNSWICK'S GREAT SALE OF

S. C. Buff Orpingtons and White Wyandottes

I herewith offer to MY MANY VALUED CUSTOMERS and the PUBLIC, their LAST CHANCE to purchase from the "CHAMPION SUNSWICK STRAIN" direct.

The property surrounding my farm has changed hands, making it impossible for me to continue the POULTRY INDUSTRY in this locality—therefore I have decided to close down, so am offering for sale both of the above BREEDS, either in A FLOCK or SINGLY, as preferred.

We offer Special Priced Cocks, Hens, Pullets and Cockerels in both Buff Orpingtons and White Wyandottes—they constitute great value for the price. Write at once

A purchase of the entire FLOCK in either breed represents a VERY VALUABLE PROPOSITION TO THE FANCIER—as the GREAT WINNING AND BREEDING LINE of this FAMOUS "SUNSWICK STRAIN" could thus be maintained—and would moreover take with it the result of 16 YEARS OF SCIENTIFIC LINE BREEDING. Write Quickly if Interested.

Barred Plymouth Rock EGGS—EGGS—EGGS—EGGS—EGGS EGGS FOR HATCHING

George Beuoy, the man who has done so much to make Capons famous, raises Barred Plymouth Rocks with a national reputation. For more than twenty consecutive years he has bred the one kind only. He specializes on the bred-to-lay kind; exhibits them in the large shows to prove that good ones can be bred from laying stock. Mr. Beuoy has shown his birds at New York, Chicago, Philadelphia, St. Louis, Kansas City, Topeka, Wichita, and more than two hundred other towns, besides winning more first prizes at the World's Fair, Panama Pacific Exposition, than any one other exhibitor. Mr. Beuoy has in all several hundred first prizes won on his bred-to-lay birds against strictly exhibition stock in hot competition. Write to him for a free copy of his new illustrated mating list showing a Barred Plymouth Rock cockerel in NATURAL COLORS on the front page. Low prices on setting eggs. Three matings: Cockerel, Pullet and Standard. A few extra good Cockerels for sale.

Special Low Prices on Eggs in 100 Lots

George Beuoy, R. R. 7, Dingley Dell Farm, Cedar Vale, Kans.

A. ALBRIGHT, JR., Owner.

Farms at Maplewood, N. J.

over 2d on size and development. First pullet has the best penciling.

Buff Cochins—A. P. Ingram, West Chester, Pa., 2-3 cock, 3 hen, 2 ckl, 1 pl, 1 old pen, 1 yearling pen; W. M. Watson, 1 cock, 1-5 hen, 1 ckl, 3 pl; Harvey C. Wood, 2-4 hen, 3 ckl, 2 pl.

Competition this year in Buff Cochins. First cock shown in good condition; a big bird. Second cock, broad, very full of feather in fluff; softer tone of color than 1st, but practically entire tail gone. First hen, round, full feathered Cochins; good front. Second hen big, a good runner-up. Cockerels show big improvement over last year; not only better developed but better Cochins. Very nice sheet of golden buff color in 1st; full, loose feathering; superior feathering on shanks. Pullets again encouraging. First pullet, the best all-round one. Second, big broad pullet, shy on middle toe feathering; Third, young.

Partridge Cochins—Mrs. Harvey C. Wood, 1 cock, 1-2-3 hen, 1 ckl, 1-2 pl. A very good showing; best we have seen outside of Mitchell's coops.

White Cochins—Harvey C. Wood, 1 ckl, 1-2-3 pl.

Black Langshans—Curnow, Johnson & Snaith, Wilkes-Barre, Pa., 2 cock, 4-5 hen, 4 ckl, 5 pl; Peter J. Innes, Bridgeport, Conn., 3-4 cock, 3 hen, 2-5 ckl, 1 pl; R. P. Keasbey, New York City, N. Y., 1 cock, 2 pl, 1 yearling pen; L. C. Phillips, Watford, Conn., 5 cock, 3 pl; Boys' and Girls' Poultry Club, West Raleigh, N. C., 2 hen; E. J. Mesick, Ardsley, N. Y., 1 hen; J. F. Robinson, South Weymouth, Mass., 3 ckl; W. A. Meyer, Bowling Green, Mo., 1 ckl, 4 pl, 1 old pen.

Nine cocks, 14 hens, 17 cockerels, 16 pullets.

First cock, good head and tail; shy in breast and rear behind legs; tail carried him. Second cock, longer thigh than 1st; large, broad backed bird, good body; not as well up in tail as winner. First hen, straight in shanks, without bend at thigh; nice back and fairly good tail. Second hen crowded her hard. Equally well balanced on straight legs, and a bird of strong body proportions. Little angular where back and tail join. Cockerels not as good as last year. The chickens are too angular. First cockerel did have a wonderful head. First pullet, the most typical

Langshan in the whole outfit. Second pullet, another good one, but lacks breast, making wedge shape.

White Langshan—Thos. W. Crowe, New Britain, Conn., 1 cock, 1-2 hen.

MEDITERRANEANS.

S. C. Light Brown Leghorn—W. W. Harrington, West Newton, Mass., 1 cock, 4 pl; Laurelwood Farm, Pequannock, N. J., 2 cock, 1 ckl; Williams Bros., Fullerton, Calif., 3 cock, 4-5 hen, 5 pl; Grove Hill Poultry Yds., Waltham, Mass., 1-3 hen, 1 pl; Allen K. Lowry, Lebanon, Pa., 2 hen; H. C. Adams, Lynchburg, Va., 2 ckl; C. Sydney Cook, Jr., West Newton, Mass., 2-3 pl; Dr. W. S. Carroll, Roanoke, Va., 1 yearling pen.

Three cocks, 10 hens, 2 cockerels, 11 pullets.

First cock, big, little high in tail. Seems that some of the best pullet breeders have this tail characteristic. First hen, smooth, nicely stippled brown, striped hackle, comb does not lop, excellent Leghorn type. First cockerel, nice texture of comb and head parts for a pullet breeder. Second cockerel, good station, and probably a likely breeder of good colored pullets; coarser in texture of comb and wattles than winner. First pullet, a superior Brown Leghorn female in all particulars; a very attractive shade of brown ground. Second pullet, lighter hackle with more penciling in it, and not quite as good type as winner.

S. C. Dark Brown Leghorn—Grove Hill Poultry Yards, 1-2-3-4 cock, 2-3-4-5 ckl; Allen K. Lowry, 5 cock, 5 pl; John T. Weidner, Reading, Pa., 4-5 hen; Laurelwood Farm, 1-2 hen, 1 yearling pen; Williams Bros., 3 hen, 1 pl; H. C. Adams, 1 ckl, 3 pl; Allen Mead, White Plains, N. Y., 2-4 pl.

Eight cocks, 5 hens, 11 cockerels, 7 pullets. First, 2d, 3d, 4th cocks, typical, big, Grove Hill birds; elegant length of saddle, bright color, beautifully striped. Particularly good comb on 3d. Second has great wealth of tail furnishings. First, a wonderful, big, good colored bird. Fifth, a racier type of bird, not as good in color, or as abundant in saddle furnishing. First hen, big, but both 1st and 2d are shy on tail coverts. First cockerel, a typical Leghorn, tail not joining back abruptly; nicely striped saddle. Bright's

cockerels have more wealth of saddle plumage and these long, numerous feathers hang down hard around the tail, making concave to tail difficult. First pullet, comb of exhibition female; rich colored hackle, coat of gray tone in ground color of back and no sheen to tail black.

S. C. White Leghorn—Henry P. McKean, Jr., Beverly Farms, Mass., 2-3-4 cock, 1-2-3 hen, 1-3 ckl, 3 pl, 1-3 old pen, 2 yearling pen; Elm Poultry Yard, Hartford, Conn., 5 cock, 2 pl; Owen Farms, 1 cock, 5 ckl, 4-5 pl, 2-5 old pen, 1-3 yearling pen; Whiting Farm, Holyoke, Mass., 4-5 hen, 4 ckl, 1 pl, 4 yearling pen; Wilburtha Poultry Farm, 2 ckl, 4 old pen, 5 yearling pen.

Thirty-six cocks, 49 hens, 65 cockerels, 51 pullets.

First cock was the outstanding 2d cockerel of last year; one of the greatest cocks ever shown; good head, wonderful back and furnish of saddle; never fused saddle a particle; good station and grand sweep from throat around under breast and body; correct carriage, and splendid furnish of tail. Some of other cocks had their saddles puffed up. This can be done by bending back the saddle feathers between thumb and finger.

First cockerel, a cobbler type of bird than Rogers and Hillview had in their 1st and 2d cockerels at Chicago; wings project beyond body. Second cockerel, elegant head, good length and sweep of back to tail, good underline. One of the great birds of the year. There was a lot of arguing with the judge on 1st and 2d cockerels. The winning hens did not have much in the way of tail coverts. First hen, more red in lobe than accustomed to see in a 1st New York hen. First pullet, very white, smooth feathering. Cushion shown in natural condition. Second pullet fails to winner in comb. No. 1323, shown by Owen Farms, was one of the most attractive pullets in the class. Fifth, best bodied pullet we have seen this year, smooth, feathering. Fourth of similar quality. Both 4th and 5th were better when we saw them than at time of judging because of hard trip to New York. Criticisms are purely technical; never was such high quality seen in New York.

Credit should be given the judge for not placing cockerels with most conspicuous puffed saddles. W. W. White has accepted position with Wilburtha Farm.

GEORGE L. RUSSELL Box 72 CHILHOWEE, MO.

S. C. Buff Leghorn—Monmouth Poultry Yards, Freeport, N. J., 3-4 cock, 1-5 hen, 5 chl, 4-5 old pen, 1-2 yearling pen; L. E. Jeriher, Marathon, N. Y., 1 cock, 1-4 chl, 3 old pen, 3 yearling pen; Jos. Johnson, Lebanon, Pa., 5 cock; C. C. Harris, Barnegat, N. J., 2 cock; Geo. W. Rex, Slatedale, Pa., 2 hen, 4 pl; Wm. E. Crevoiserat, Freeport, N. Y., 4 hen, 3 pl, 2 old pen; Geo. W. Cisco, Hawthorne, N. J., 3 hen, 1 old pen; J. Quincy Dawson, Coshocton, Ohio, 2 chl; F. S. Smith, Hamilton, Ohio, 3 chl; P. H. Yost, South Bethlehem, Pa., 2 pl; H. R. Nowlen, Lebanon, Pa., 1 pl; Henry Laufenberg, West Hoboken, N. J., 5 yearling pen; Glenwood Poultry Yards, Rutherford, N. J., 4 yearling pen.

Fourteen cocks, 22 hens, 32 cockerels, 23 pullets.

Buff Leghorns continue to show marked improvement. Keen competition. First cock, good type and level color. Several good cocks, under ribbons; good color up to 5th which was rich in color. First hen, a beautiful sheet of color; rather thick in comb. Second, long body, very soft, level color; least bit of pepper in tail. Third, another strong hen. Fourth, deeper bodied.

First cockerel, good Leghorn, neat comb and nice texture; one double point; golden buff throughout; some black in tail. Second, a close runner-up. Third, tail curved down, which spoils him. First pullet, good color, and type when she stands right. Second, superior comb and extraordinary Leghorn type and feather; even level color; a shade richer in color than winner.

S. C. Black Leghorn—Jos. J. Laufenberg, West Hoboken, N. J., 2 cock, 5 hen, 3 chl, 1 yearling pen; Gerald B. Wadsworth, Hempstead, N. Y., 1-5 cock, 1-3 hen, 1-2-4 chl, 2-4-5 pl; Wm. R. Mollincaux, Hempstead, N. Y., 4 cock, 4 hen, 5 chl, 1 pl; Mrs. C. Gugel, Secaucus, N. J., 3 cock, 2 yearling pen; Milo L. Myers, Marysville, Ohio, 2 hen, 3 pl.

Seven cock, 9 hens, 11 cockerels, 9 pullets. The best class of Black Leghorns seen this year. Type, feathering and color shown to advantage. First pullet a big improvement on females that have been brought out elsewhere. First and 2d cocks and 1 cockerel good, although better comb on latter would improve him.

R. C. Light Brown Leghorn—Gus Stadler, Altoona, Pa., 1 cock, 1-4 hen, 5 pl; Duel C. Lake, Oneonta, N. Y., 2 cock, 3 pl; Kerlin Farm, Pottstown, Pa., 2-3 hen, 1 chl, 2-4 pl, 1 old pen; Percy Johnson, Lockwood, R. I., 5 hen, 1 pl.

R. C. Dark Leghorn—Gus Stadler, 2 cock, 5 chl; Kerlin Farm, 3 cock, 1 hen, 1 pl, 1 old pen; Wm. T. Liddell, Greenwich, Conn., 1 cock, 1-2 chl; Edwin N. Jewell, Peekskill, N. Y., 3 chl; Percy Johnson, 4 chl.

First Rose Comb Dark Brown Leghorn cockerel, extra good in type and color. Top of the class.

R. C. White Leghorn—Chas. H. Damon, Ballston Spa, N. Y., 2 cock, 1 hen, 1 chl, 1 pl; Wm. L. Palmer, Granville, N. Y., 1 cock, 3 hen, 4 chl, 3-4-5 pl, 1 young pen; J. M. Chase, Wallkill, N. Y., 3-4 cock, 2 hen, 2-3 chl, 2 pl; Dr. B. E. Decker, Bradford, N. Y., 5 cock.

Five cocks, 3 hens, 4 cockerels, 5 pullets. First Rose Comb White Leghorn cockerel and pullet a strong pair. It is hard to get a firm rose comb on a Leghorn female.

S. C. Black Minorca—Prospect Farms, 1 cock, 1 hen, 1-2 chl, 5 pl, 1 young pen; T. D. Hook, Columbia, S. C., 2-3-4 cock, 4-5 hen, 2 old pen 2-3 young pen; Arthur S. Hillhouse, Rutherford, N. J., 5 cock; F. E. Paige, Medina, N. Y., 2 hen, 4 chl, 3 pl, 1 old pen, 4 young pen; James H. Vincent, 3 hen, 3-5 chl, 1 pl; A. Didriksen, Whitewater, Wis., 2-4 pl.

Ten cocks, 12 hens, 13 cockerels, 13 pullets.

Minorca males had double cages which were provided at a cost of 65 cents extra on each bird entered. The equal of this class has not been seen this year. First cock had wonderful development; elegant length of saddle and fine furnish of tail; a big body, full of feathers and every feather in its place; blade of comb a trifle sharp. Second cock, another wonder. Shading and zinc ointment would have cleared up his lobes and improved him. First hen, grand size, good type. Second, another big, rangy hen. First and 2d cockerel, very large, long birds, good station. Elegant furnished tail on 1st and good comb, wattles and lobes. First pullet, big, strong bird, long in back and body.

S. C. White Minorca—Hamilton Egg Farm, Rochelle Park, N. J., 1-3 cock, 1-2-3 hen, 2-4 chl; Wm. Rylance, St. Albans, N. Y., 2-4 cock, 4 hen, 1-3 chl; Jos. F. Reichert, St. Cloud, Minn., 5 hen.

First, White Minorca hen, a very large, good bodied White; long, good station.

Blue Andalusian—E. D. Bird, Greenwich, Conn., 3 cock, 5 chl, 1 old pen; Jennings & Dobe, Buffalo, N. Y., 1-2-4-5 cock, 1-2-4 hen, 1-3 chl, 2-3-4-5 pl; John Mac Courtie, Winchester, Can., 3-5 hen, 2 chl, 1 pl, 2 old pen; C. W. B. Wheeler, New York City, N. Y., 4 chl.

Seven cocks, 8 hens, 8 cockerels, 8 pullets.

First, a grand big cock; elegant lacing on breast and fluff and wing bay; splendid back and tail shape. Second, not as heavy bodied a bird; clear-cut lacing; very blue tail. First hen, good head, back and tail; good body and proper station; very blue in tail; remarkable hackle lacing; well laced all over, with a nice blue ground color. Second, another big hen of splendid type; good head; stronger edging than 1st and carries all the way out into laced tail coverts.

First cockerel, big, well grown fellow; excellent style and carriage. Second, another bird of similar type, not as soundly laced in

breast as winner. First pullet, good lacing; good head; a little long in thigh and will settle down with age, making a better hen. Second pullet, much cleaner blue ground color than winner, but not as heavy lacing. Excellent type in 2d. Third, more Leghorn type and heavier lacing.

S. C. Ancona—H. Cecil Sheppard, Berea, Ohio, 1-2-4-5 cock, 2-5 hen, 5 chl, 1-4 pl, 1-2 old pen, 2-3 young pen; G. & W. Ratz, Tavistock, Ont., 3 cock, 1-4 hen, 1-2 chl, 3 pl, 3 old pen, 5 young pen; Frank C. Stier, Lakewood, Ohio, 3 hen, 3-4 chl, 2-3 pl, 4 old pen, 1 young pen; George M. Sault, South Hadley, Mass., 4 young pen.

Twelve cocks, 12 hens, 16 cockerels, 16 pullets. The strongest class of the year.

First cock had balance, good head, nice back and tail; snappy ticking in breast, fluff and wing bar. This question of balance is of primary importance in the breed. Too many males are low behind, breast high and tail shooting up. Get the legs in the center of the bird and he will have better balance. To do this, breed females whose legs come out of their middle and not out of their rear. Sheppard beat the others to it on balance in his males. He had it in his males last year, and comes back again this year. His 2d cock, similar in type to 1st, but fails to win in soundness of face. Third cock fails in comb to 1st; good back and finish of tail; mottled from throat to hocks, and excels the class in neat white tips on hackle and saddle hangers. This is a cock in front of whose coop you can hold a piece of paper that cuts off from view his breast and fluff, and still know that he is a Mottled Ancona and not a Black Leghorn, because of the ticking on his top parts.

First hen, excellent type; sound black tail; sound wing flights, nearly every primary and secondary ending in a white tip; nicely mottled all over, being evenly tipped on neck and throat as well as back, wing bows and breast. Second hen, better in comb than winner; good type, nicely mottled all over; sound wings; not quite as neat and snappy a white tip. Third hen, trifle shorter in back, more of Leghorn carriage; trifle darker than 1st and 2d. All hens to win here are glossy in green sheen. Fourth, a five-year-old hen, showing that Anconas can hold their color.

First and 2d cockerels much alike; good heads; good type, nice tails, well mottled in hackle and saddle; 1st having elegant tipping on wide feathers at base of tail. Cockerels are steadily improving from year to year, and competition was hot.

First pullet, good back and tail and nicely mottled. Second pullet excels in comb and has blacker head than winner; not as well mottled on throat; carries tail a trifle higher. It was a close race. Ancona men are to be congratulated on the quality they are producing.

R. C. Ancona—H. Cecil Sheppard, 1-3-4-5 cock, 1-2-4 hen, 1-2-3-5 chl, 2-3-5 pl, 1-3 old pen, 1-3 young pen; G. & W. Ratz, 2 cock, 3-5 hen, 4 chl, 1-4 pl, 2 old pen, 2 young pen;

EVERY DAY

Is "PAY DAY" When You Have

AMERICAN POULTRY FARMS

BRED-TO-LAY QUALITY BRED-TO-LAY

CHICKS - EGGS - BREEDERS

Nothing is so gratifying to the poultryman as to go out day after day in the cold winter months, and gather a good supply of eggs. It is not only the money value of the eggs, but it means that he has succeeded where so many have failed. For sixteen years egg production has been a study with us, and we have succeeded to the point where we believe our hens just can't help from laying. It is just this kind of stock we are ready to pass on to you. We have nearly \$50,000 invested in poultry equipment and thousands of dollars in fowls themselves. All this proves but one thing: we can supply you with Bred-to-Lay stock that do lay.

Rocks, Reds, Leghorns, W. Wyandottes, Buff Orpingtons

We have not lost sight of the fact that beauty is a big factor in the pleasure as well as profit gained in poultry. They are bred for standard qualities as the show winnings prove. They are just what you will want to build up your flock, or get for foundation stock, which will show its good blood for years to come.

AMERICAN POULTRY FARMS, Route E, CHURUBUSCO, IND.

Just-a-mere Poultry Farm, Manasquan, N. J., 4 young pen.

Six cocks, 9 hens, 6 cockerels, 7 pullets. The Rose Comb Anconas here show more quality than at any other show in America.

ENGLISH CLASSES.

S. C. Buff Orpingtons—Campbell Soup Farm, Riverton, N. J., 2-3 hen, 1-3 ckl, 2 pl, 1-3 old pen, 1 young pen; Floyd M. Dodge, Frankfort, N. Y., 3 cock; W. A. Jamison, Holmdel, N. J., 2-5 cock, 5 ckl; Lucknow Farm, South Norwalk, Conn., 4 cock, 1-4-5 pl, 2-5 old pen, 2-3 young pen; Robadel Farm, Cos Cob, Conn., 5 hen, 3 pl, 4-5 young pen; Henrietta E. Hooker, South Hadley, Mass., 4 hen; Prospect Farm, 1 hen, 4 old pen; Jos. R. Seitz, Ridgefield, N. J., 2 ckl; W. W. White, Red Bank, N. J., 4 ckl.

Twenty-one cocks, 35 hens, 39 cockerels, 29 pullets.

Leading breeders laid low all season and came into New York with the greatest entries of quality Buffs ever cooped in this big Buff Orpington center.

First cock, grand big fellow, broad and deep, good head, sound buff wing, quills included; a wonderful sheet of golden buff; tail matches. Second cock, another big bird. These birds have backs. Such massiveness cannot be secured in short, coupled-up birds. Third cock is not as well finished in tail. Fourth lacks massiveness. Fifth won 2d last year; a low-down bird. First hen, big, smooth feathered, level colored bird. Second, another equally smooth feathered, even colored Buff; lig and of good type. Third, of same type. Fourth, neater cut hen, wins shape special; we doubt the ability of such a matron to produce the necessary massiveness in males, but special recognition of this type emphasizes the importance of clean lines.

First cockerel, a broad shouldered fellow that carries his width all the way back onto a nicely rounded, well furnished tail. One shade of rich golden buff. Second, another broad bodied bird in front, but not as broad across tail; better comb than winner. Third, another big one, a shade lighter in color than winner, and somewhat clearer in main tail feathers: one crooked toe. Fourth, nicely grown, well put down cockerel of good quality. First pullet, starts good with a clean head and nice comb and runs smooth all over; remarkable sheet of soft buff color; clear tail. Second pullet, big; good type; not as good in tail as winner. Wm. Hobbs, of Campbell's Soup Farm, was a happy man; he has a great line of males.

S. C. Black Orpingtons—Robadel Poultry Farm, 1-2 cock, 1-2-4 hen, 2-3-4 ckl, 1-2-3 pl, 1-2 old pen, 1-2 young pen; Wm. Cook & Sons, Scotch Plains, N. J., 4 cock, 5 ckl; Edw. C. Lutz, Middletown, Pa., 3 cock; Wm. I. Georgius, Baltimore, Md., 5 cock, 5 hen, 1 ckl, 5 pl; Harold E. Burns, Riverhead, N. Y., 3 hen, 4 pl; Mrs. Stuart Hartshorn, Short Hills, N. J., 3 young pen.

Six cocks, 5 hens, 6 cockerels, 6 pullets. First cock, an uncommonly big fellow, strong in green sheen and in good feather. First cockerel, big, well developed, and of good quality. Females as a whole are lower down and heavier in fluff and cushion than win in Whites and Buffs.

S. C. White Orpingtons—Robadel Poultry Farm, 3-4 cock, 1-2-5 hen, 3-4 ckl, 2 pl, 2-4 old pen, 2-4 young pen; L. F. Loree, West Orange, N. J., 5 cock, 3 hen, 3 pl; Morris Poultry Farm, Lebanon, Ohio, 1-2 cock, 4 hen, 5 ckl, 4 pl, 1 old pen, 3 young pen; Till Farm, Plainfield, N. J., 1 ckl, 3-5 old pen, 5 young pen; W. A. Jamison, 2 ckl; John R. Johnson, South Windham, Me., 5 pl, 1 young pen.

First and 2d cocks, a team of grand, big, massive cocks, in good feather. These birds have bone, depth and thickness. First hen, the smoothest feathered hen that has ever won in this class. Was 1st last year. She was something of a sensation this time, shown in potless condition, and was the conceded winner. Second hen stands a trifle higher, just as good in substance of body, but not as hard feathered. First hen had the feather of a White Rock on an Orpington. Third, smooth feather: hangs a little in front and pinched in tail. First cockerel, very type bird, good head: smaller bird than accustomed to see win here. Second, bigger cockerel, good type: tail needs more age to finish. Hatched from Jill Farm's eggs. First pullet, good head, clean-cut lines; smooth feather. Second pullet, white: broad over back: good breast. Third pullet, another good pullet, with as perfect a comb as ever seen in any breed. Pretty hot class of pullets. Hubbard, the old wizard of Robadel, pulls out best display in Whites for the third time; also gets display in Blacks. He gives the specialty breeders a 3 to 1 shot, for he handles Buffs, Blacks and Whites. Harold Rawnley was a happy man. His line of males have bone and massiveness. It is hard to beat this type of male in Whites and Hobb's males in Buffs.

S. C. Blue Orpingtons—Manetto Hill Farm, Hicksville, N. Y., 2-4 cock, 1-2-3 hen, 1 old pen, 1 young pen; Wm. Cook & Sons, 5 cock, 5 hen, 1 cockerel, 1 pl; The Brighthorne

Farms, Roslyn, N. Y., 1-3 cock, 2 pl; Ernest Davis, Hartford, Conn., 4 hen.

First cock, 1st and 2d hens, tops of class. Good type in 1st pullet; smoky ground color. First cockerel lacks type.

Speckled Sussex—R. E. Haeger, Algonquin, Ill., 1-5 cock, 3 hen, 2-3 ckl, 2-3-4 pl, 1 old pen, 1 young pen; W. A. Jamison, Holmdel, N. J., 4 cock; B. O. Schilling, Rochester, N. Y., 2-3 cock, 1-2 hen, 1 ckl; J. DeVer Rogers & Son, Jr., Oxford, N. Y., 4-5 hen, 1-5 pl, 2 old pen, 2 young pen; Wm. H. Whitem, Philadelphia, Pa., 5 ckl; Charles Gerlach, Allentown, Pa., 4 ckl.

Thirteen cocks, 16 hens, 12 cockerels, 15 pullets. Keenest competition in Speckled Sussex that has yet been seen. When the individuals are topnotchers such numbers are more than sufficient to provide fast going.

First cock, a regular Dorking, big and long; white flights and tail. Second cock, sound wings and tail, big spangle in breast. Both birds have tipping on top. First hen, clean lines and clear ground color, each feather beautifully marked. Second hen not as good in clearness of breast markings.

First cockerel a nicely marked bird, but stands too high for a Sussex, and is a long jump from type of 1st cock. Second cockerel has a heavy black stripe in neck which gives shawl effect; black stripe in back is too long and intense. Such heavy striping produces ticking in ground color of pullets. First pullet, about what is wanted both in type and color, except for slight black ticking in ground color of back. Second pullet, another good one, with similar qualifications.

Red Sussex—Mamasasca Farm, Ridgefield, Conn., 1 cock, 1 hen, 1 ckl, 1 young pen; Rees Evans, Ardmore, Okla., 1 pl.

First Red Sussex hen, a splendid specimen. **Silver Gray Dorkings**—Watson Westfall, Sayre, Pa., 2-3-4-5 cock, 1-2-3 hen, 1-3-4 ckl, 1-4-5 pl; Charles H. Yaple, Richford, N. Y., 1 cock, 4 hen, 2-5 ckl, 2-3 pl.

Strong class of cocks. First, lowest set bird. First hen had type and color; good size in both 1st and 2d hens. First cockerel a wonder: long back, correct tail; deep breast and long keel; good head; clear white top; sound black breast and body. First pullet, deep breast and body; good top and bottom lines; free from shafting in back; fine stippling.

White Dorkings—Charles H. Yaple, 1 cock, 1 hen.

Colored Dorkings—Charles H. Yaple, 1 cock, 1 hen. A good pair.

Dark Cornish—Alfred Birch, Seaforth, Liverpool, England, 1-5 cock, 1 hen, 1-2-3 ckl, 1-5 pl, 1 old pen, 2 young pen; Louis S. Myers, Hanover, Pa., 4 cock; W. A. Fitzpatrick, Scranton, Pa., 2 cock, 5 ckl; Frank H. Clement, Bethlehem, Pa., 3 cock, 2 hen, 3 old pen; Marcy Farm, Matawan, N. J., 4-5 hen, 2-3 pl, 2 old pen, 3 young pen; Stuart D. Talbot, Edmeston, N. Y., 3 hen, 4 ckl, 4 pl; A. D. Tuck, Scranton, Pa., 1 young pen.

The birds from England put it over; low set, broad specimens; nothing extra in comb, but great in type. Very wide fronts, whipped tails, short legs, with heavy bone. One cockerel with what looked like shoeblackening at base of hackle, left out. First cock had couple of flight feathers out.

White Cornish—Hill-Top Poultry Yards, 1-2-3 cock, 2-3 hen, 2-3 ckl, 2-3 pl; F. Bates Wilson, Jamestown, N. Y., 1 hen, 1 pl; L. J. Smith, Deep River, Conn., 1 ckl.

FRENCH AND CONTINENTAL CLASSES

Mottled Houdans—Buck Bros., Oxford, Mass., 5 cock, 5 ckl, 1-4 pl; W. F. Bast, Phillipsburg, N. J., 2-4 cock, 1-3 hen, 3-4 ckl, 2-5 pl, 2 old pen, 2 young pen; Wildwood Farms, Sayville, L. I., N. Y., 1 cock, 2-4 hen, 1-2 ckl, 3 pl, 1 old pen, 1 young pen; Wm. Mackey, Swift Current, Sask., Can., 3 cock.

The best type, color and all-round quality in Mottled Houdans that we have seen this year. If elongated Dorking type is wanted, 2d cock had it. If a distinctive Houdan type

Chicks Drooping-Dying?

Don't Let Roup Rob Your Roost

When your chickens have these symptoms—face swollen, running at eyes and nose, comb pale, whistle or sneeze when breathing, breath with catarrhal odor—that's Roup. Don't let it get a start—it is a germ disease and may destroy your entire flock. Ask your dealer for

Conkey's

ROUP REMEDY

Just put it in the drinking water—chickens doctor themselves. It kills the Roup germs and saves the fowl. Equally important as a preventive, for it keeps Roup from getting a start. Sold by dealers everywhere—30c, 50c, \$1.20; 5-pound can, \$7.25. Conkey's Poultry Tonic is a Regulator, Laying Tonic, Moulting Powder and Chick Conditioner of the highest type. No cayenne pepper—no filler. 30c and 60c. It pays to buy by the pail \$1.40. Conkey's Poultry Book worth 60c to anyone who keeps chickens sent for 6c, stamps (20)

POULTRY ACCOUNT BOOK

Keep an account of eggs laid and feed bought. Know where the money goes. Start the new year by keeping a cost account on your flock. Our POULTRY ACCOUNT BOOK will help you do this. It was made for this purpose.

This book contains space to keep a detailed daily record for one year of Eggs Laid, Value of Stock Sold, Eggs Sold, Eggs and Stock Used for Table, Expenses for Labor, Feed and Miscellaneous. With the aid of this book you can tell where your leaks are, where the profits come from, and it will serve as a guide to making your business more profitable. Printed on good quality writing paper suitable for ink. Price 25 cents.

Here Is What One Poultry Keeper Writes:

Santa Ana, Calif., Dec. 16, 1920

Enclosed herein find \$1, for which please send me four of your Poultry Account Books, priced at 25 cents each. I have already purchased one, and find it exactly what I want.

CHAS. M. ADAMS.

AMERICAN POULTRY JOURNAL
523 Plymouth Court :: CHICAGO, ILL.

is wanted, back a little shorter than a Dorking's, tail a little higher, whole bird more active, the 1st cock had it.

White Houdans—Imperial Poultry Farm, Elizabeth, N. J., 1-2-3 cock, 1-2-3 hen, 1-2-5 chl, 1-2-4 pl, 1 old pen, 1 young pen; H. F. Goemann, Grantwood, N. J., 4-5 hen, 4-5 chl, 5 pl; Chester Becroft, New York City, 3 pl.

An attractive display, the females having the better of it in type.

Silver Campines—Homestead Campine Farm, Wayland, Mass., 1-2-3 cock, 1-2-3 hen, 1-2-3-4 chl, 1-2-4 pl, 1 young pen; Hanson Duval, East Islip, L. I., N. Y., 4 cock; Will H. Becker, Martins Ferry, Ohio, 4 hen; W. E. Pakenham, Norwood, Ont., Can., 5 chl, 3-5 pl.

Strength of the class lay in 1st, 2d cocks, 1st, 2d cockerels, 1st hen, and the wonderful 1st Boston pullet, which won 1st here. It would be repetition to again print what we say in the Boston show report about this line of Silver Campines.

Golden Campines—K. T. Nelson, Camden, N. J., 3 cock; Mrs. B. W. Brainard, Ulster Park, N. Y., 1 cock, 3 hen, 2-5 chl; T. O. Perry, Greenwich, Conn., 2-4 cock, 1-2 hen, 3-4 chl, 2-3 pl; C. G. Battles, Wellington, Ohio, 1 chl, 1 pl.

First hen, the outstanding 1st pullet of last year. A superior individual, good type and wonderful barring.

Death of D. O. Barto.

D. O. Barto, head of the poultry work, University of Illinois, passed away at his home in Urbana, Ill., on January 18. Prof. Barto had been in charge of the poultry work at the state college since 1911. With small means for his work in poultry, he accomplished much, and did infinitely more than most men could have done working under similar conditions. Prof. Barto had many close friends, and all who knew him loved him.

S. C. Buff Leghorns at Chicago Show.

By Geo. Gable.

While attending the Chicago Coliseum Show this season which started Dec. 1 and ended Dec. 6, 1920, I had the pleasure of looking at a very good class of S. C. Buff Leghorns, well representative of quality birds. I spent the biggest part of my time in the Buff Leghorn aisles, and came in contact with many enthusiastic Buff Leghorn breeders who seemed to be quite well pleased with the judging. As we all know, Judge Rikhoff had a task on his hands, with that large class of Brown Leghorns and from thereon to the Buff Leghorns. This is enough to unstring most anybody's nerves, but Judge Rikhoff was right on the job and did fine work.

The biggest part of the breeders are getting the right shade of buff on their birds, but I will have to criticize some of the birds' type, and here is the way they looked to me: First cock, good comb, good eyes and lobes, good full breast, nice long back, a long tail with a good number of tail coverts and good width to feathers, quite strong in this particular section. A nice even soft color. Second cock, fair comb, good eyes and lobes, full breast, not as long in back as first cock, a thick body, angle at the tail and not so low in tail carriage as first cock; stood up quite well on legs. A good sound bird of a light shade of buff with strong under color and quite even color. Third cock, fair comb, good eyes and lobes, good full breast, medium length to back, good full tail well finished, could stand a little more length to legs; a darker shade of buff than 2d cock, but even in color. Fourth cock, comb a little large, good red eyes and white lobes, full breast, with fair back shape and low tail carriage, but tail in poor condition. He was a light shade of buff, but very even, good strong undercolor. Fifth cock, fair comb, good red eyes and white lobes, nice shaped breast; fair length to back, good long tail well spread, and showed signs of plenty of tail furnishings, but not ready for the show room; not long enough on legs, a good even colored bird of that medium shade of buff.

First hen, good shaped comb, red eyes and white lobes, good arched neck, nice full breast, a beautiful long curve to back, and a long low and well spread tail and saddle feathers extending back over tail nicely, a typical Leghorn in every respect, with a very creamy

shade of buff, and very even. Second hen, good comb, red eyes and white lobes, good full breast, long back, but not as well curved and not as good in tail section as first hen, with a little darker shade of buff than first hen. Third hen, quite good in comb, red eyes and good lobes, full breast, not as long a bird as second hen and a little more blocky and a little higher in tail than 2d hen, even in color and the same shade as 2d hen. Fourth hen, fair comb, red eyes, white lobes, long body but shy in the breast, low tail, good colored hen, but out of condition. Fifth hen, fair comb, good eyes, white lobes, full breast, not as long in body as 4th hen, and a shorter hen, also a little darker in color.

First cockerel, good comb, red eyes, white lobes, good breast, fair length to back, good well spread tail, well furnished, and a little lower tail would give this bird a good curve to back. For color he is hard to beat, very even from top of head to tip of tail, of that nice soft golden buff. A beauty for color. Second cockerel, good head work, red eyes, white lobes, a Leghorn breast, a good back shape, a nice long well furnished tail, too short in shanks and thighs, a good even color, and a little darker shade of buff than 1st cockerel. Third cockerel, a quite good shaped bird, a good small comb, nice red eyes, white lobes, nice breast shape, good shape to back, a good carriage and well spread tail. A quite good colored bird but not matured. Fourth cockerel, a good big rangy bird, well up on a pair of slender legs, good full breast, a long curved back, a good long, low, well spread tail and well covered over with plenty of tail furnishings. This cockerel was pronounced by a good many to be the best shaped male in the Buff Leghorn class. His comb was fair; could stand a little improvement. He is of a medium shade of buff. Fifth cockerel, a long slender bird, way up on yellow legs, red eyes, white lobes, comb a little high, a little shy on breast shape, good low and well spread tail. A nice shade of that soft golden buff.

First pullet, a nice long bird with good full breast, good back shape, a low well spread tail, stands up nicely on a good pair of yellow legs, good comb, red eyes, white lobes, nice even shade of medium buff. Second pullet, fair comb, red eyes, white lobes, full breast, long back, fair spread tail, good yellow legs, medium shade of buff. This pullet would not have looked bad in first place. Third pullet, a very good bird, nice long body, good breast, neat head work, low tail, good length to legs, not quite far enough along, good even shade of buff color. Fourth pullet, good comb, red eyes, very white lobes, long slender body, low well spread tail, good breast, stands nicely upon legs, medium shade of buff and a little shy on weight. Fifth pullet, fair comb, red eyes, white lobes, good breast shape, not quite as long in back shape as 4th pullet. Good spread tail and fair length to legs, medium shade of buff.

John S. Martin Declines to Run for President of the A. P. A.

To the Members of the American Poultry Association:

My name has been suggested as a candidate for president of the American Poultry Association, and the offers of support that have come to me have been most gratifying. I would consider it a great honor to serve, but I feel that at this time the president of the American Poultry Association should be a man who is able to give practically his whole time to the affairs of the association. This I am unable to do, and for that reason I wish to state that I am not a candidate. However, I shall be very glad to continue to co-operate with my fellow members in the work of the association in any capacity I can be of service, as heretofore.—John S. Martin.

A Correction.

I noticed in your list of winnings at the Heart of America Show, Kansas City, Thanksgiving week, 1920, that you give Second, Third and Eleventh Young Pens to Owen Farms. Will you kindly add these winnings to the fine winning made by Mountain View Farm, Denver, Colorado; B. D. Townsend, proprietor. Owen Farms did not exhibit at Kansas City.—Maurice F. Delano, Proprietor, Owen Farms.

S. C. BUFF ORPINGTONS

Eight grand pens mated. A collection of the finest and best type of exhibition color. If searching for quality foundation stock do not delay your order.

Selected hens and pullets headed by prize-winning birds at Chicago Coliseum and Ohio State Fair. Prices only one-half considering quality of stock. Write for full information.

Vice-Pres. American Poultry School.

Let These Experts Tell You WHY

You Can Make More Money from Poultry this Year than Ever Before

Here's some good news for poultry raisers. With feed prices coming down, egg and poultry prices high, and these famous poultry experts to guide you, there is absolutely no reason why you cannot make bigger money raising poultry this year than ever before.

Our business is to help you—show you how to do it. That's why we have added these FIVE famous poultry experts to our already large and able staff. They are men who are recognized the country over as the greatest authorities on the care, management and feeding of poultry. They are the "top-notchers" in the poultry world.

They Will Help You Solve Every Poultry Problem

R. V. Hicks, vice-president of our organization, was formerly manager of the "Million Egg Farm" and president of the American Poultry Association, also president of the National Poultry Federation.

H. R. Lewis, of New Jersey College of Agriculture and Experiment Station, is our special advisor on feeding, culling, lighting, housing and poultry farm management, author of "Productive Poultry Husbandry."

J. H. Robinson will act as special advisor on selection, mating and breeding; author of "The Fundamentals of Breeding," formerly with the U. S. Department of Agriculture.

J. R. Corliss is at your service as special advisor on co-operative marketing and farm management. He is owner of the world's largest hen farm and president of the California Poultry Producers' Association.

J. A. Hanson, owner of one of the largest and most successful hatcheries and poultry farms on the Pacific coast, will advise you on many of your most vital poultry problems.

In addition to these five men our staff comprises such experts as T. E. Quisenberry, president; V. O. Hobbs, former president of the Missouri State Poultry Board; H. H. Knapp, president of the National Baby Chick Association; C. T. Patterson, formerly director of the Missouri State Experiment Station; E. C. Branch, one of America's foremost judges; Walter Burton, formerly in extension service of U. S. Dept. of Agr.; W. Hogan, who has given the world the most accurate system of selecting the laying hen without the aid of trap-nests, and Carlton Quisenberry, who superintended the American Egg Laying Contest and managed the Full-O-Pep Chick Company, making the largest and most able staff of poultry experts ever assembled in one organization for the purpose of giving helpful service to poultry raisers.

You Need My FREE Book NOW!

No matter how long you have raised poultry, my new 100-page book will tell you things that will be worth hundreds of dollars to you. Learn how to get the the best results. Read how thousands of poultry raisers have turned failure into success by following my secrets and up-to-date methods as given in this book. *T. E. Quisenberry*

More Profits for You

Free
Book
Tells How

This is the "Year of Years" for all poultry raisers. Eggs and poultry are sky high and feed prices much lower. This means more dollars profit if you know how to feed the proper grains, how to get a greater egg yield, stronger fertility and bigger hatches.

This Free Book Tells You This Book Shows You

- Actual pictures of the best and latest developments in poultry raising.
- Scenes from the largest commercial farms.
- Hens that have made world's egg records.
- Back yard poultry plants paying over \$1,000 profits a yr.
- Farm flocks paying from \$2,000 to \$10,000 profit a year.

Mr. T. E.
Quisenberry,
**The American
Poultry School,**

Desk 2065 Kansas City, Mo.

Dear Mr. Quisenberry: — Please send me without obligation on my part, your new 100-page book which tells me "How to double my egg yield, save feed and make more profit from my poultry."

Name

Address or R. F. D.

Town State

40 Hens Laid More Than 300 Eggs In One Year.

"I have made more progress in the five years since I enrolled with you people than I had in twenty years before. I have 40 hens which passed the 300-egg mark in twelve months. It is all due to the advice and training that I received from the American Poultry School."

—J. R. Harlan, Oregon.

\$4560 Profit in a Year

"My flock of 1500 hens made me \$4560.00 profit last year. The big part of my success is due to you, and your suggestions."

—L. M. Latttridge, N.Y.

Made \$577.75 From 84 Hens

"Have just been delivering Thanksgiving eggs. We've only 85 hens and commenced following your methods on January 1st. I have figured up, and since that time have made \$577.75 profit."

—Mrs. J. B. Belknap, Iowa.

50% Egg Yield in December.

"My flock of 550 hens and pullets made 50% egg yield this December. The high price of eggs, and your advice on how to feed the cheaper grains have made me good profits."

Harry E. Merwin, Ohio.

Raised 3000 Heavy Laying Pullets

"This year I raised over 3000 pullets. They are now making a heavy egg yield and I sell them at \$1.05 a dozen. I have certainly done a good years work by applying your principles."

E. J. Sohmers, New York

RHODE ISLAND REDS

The Most Popular Breed of Today

If you are already raising Rhode Island Reds, double your capacity, as the demand is far beyond precedent. If you are not a breeder, get wise and start in at once.

Red alloy in nine-tenths of the shows is not only the longest alloy in the showroom, but it is filled with a spirit of bubbling, effervescent enthusiasm to be found nowhere else in the building. This proves the superiority of the Reds as an exhibition fowl, but no breed, however fascinating, could win and hold such popularity without the true merit possessed by the Reds.

Rhode Island Reds are a "Made-in-America" breed, one especially developed to suit American needs, one which has stood the test of every climate, hot or cold, wet or dry, and which thrives in the cold regions of northern Canada as well as in the torrid regions of southern Texas and Arizona.

If you want to raise the best breed, raise Rhode Island Reds. For further information about this wonderful breed, address

Rhode Island Red Club of America
W. H. CARD, Secretary
Dept. A Manchester, Conn.

Hard Work Makes Master Breeders.

(Continued from page 151)

carriage and proper station and length of legs have taken their place.

While it took a little longer to eliminate light shafty breasts in the male birds and light quills in breast and back of females, pinched tails, pumpkin necks, short keel bones and wavy wings are almost entirely things of the past, at least at the best shows. However, let us not allow our enthusiasm to cause us to be misleading. While the day of the pumpkin necked Red at the poultry show has gone, the day of the entirely even colored Red is not yet quite here. And this lack of evenness is not a characteristic of Reds alone, it is just as true of any fowl not black or white.

Many reports of shows speak of numbers of Reds with hackles exactly the same shade as the backs. It is true many birds are seen with hackles almost as dark as the backs, while occasional perfectly even birds are also seen, but the show room light is often very kind, and birds which look perfectly even in the show room will show a variation in color when taken to the light. I speak of this here because I think misleading the public always brings disastrous result. Either smaller breeders become discouraged because they cannot produce birds approaching those they see described or reading so much of these perfectly even birds, they expect to purchase them for small sums, while in reality these birds are very rare and worth, when they are sold, a great deal of money.

Value of the Exhibition Pen.

Perhaps the pen classes at the shows best indicate the progress made in Reds the last few years. Any one may produce one or two outstanding birds of exhibition quality through luck, by freak matings or grow such birds from eggs which they purchased from bigger breeders. Or he may purchase a pullet, a hen, a cockerel or a cock bird to show, while pens, coming higher in price, are not so often purchased for exhibition. A pen of four pullets which match in size, type, head points and color, with a male bird which balances them in size and matches them in tone of color, all of good enough quality to stand a chance of winning at one of our best shows can seldom be selected except from flocks containing numbers of other birds with equal or almost equal quality. You will understand the reason for this, if you reflect that no birds can be used which have gone by for exhibition purposes, that all immature birds must be discarded and all that do not match this particular shade of red.

Consequently a few years ago the pen class was usually small and seldom did any but the most skilled breeders attempt show pens, at least at the national shows. While new and comparatively unknown names sometimes appeared among the winners in the single classes at our national shows, seldom did they ever appear among the exhibitors in the pen classes. The last two or three years, however, new names have been appearing in young pen classes and this year at Chicago several new exhibitors showed creditable young pens.

MANKATO INCUBATORS

FACTORY TO USER

THE OLD RELIABLE HATCHER

with a record. Made by experts of 27 years' experience building and operating incubators and raising poultry. Wonderful special features, makes the Mankato the leader of all incubators. It hatches the highest per cent of strong chicks in any climate, winter or summer. Sold at lowest price under strong binding guarantee. It is the one high class hatcher that is made right and sold right. Don't experiment, get the dependable quality Mankato that has stood the test of time.

NO BETTER INCUBATOR MADE

Well made of best material in natural wood finish, three thicknesses of walls, heavy pure copper hot water tank and boiler, perfect automatic regulator, correct ventilation, safety lamp, large oil tank—one filling to hatch, high nursery, tested thermometer, etc. Heavy well insulated wall construction and special double heating system insures uniform temperature and highest percent hatches.

Largest factory in the North-West.

All set up ready for use. The most durable, simple, sure, safe, handsome. Also Brooders for Outdoor and Indoor Use. Big new annual book and catalog free.

Not only has the number of young pens increased greatly in the last few years, but the quality has progressed with astonishing rapidity. Young pens now are much better matched and of amazingly better quality all the way through than we could find in pen classes only a few years ago.

All that was true of young pens was emphasized in the old pen classes. The first old pen class I ever saw at Chicago was about as much like the class showed at that show or at the Kansas City Club Meet this year, as a mule is like a thoroughbred race horse. As I think of the old pen classes during the first five years we showed at Chicago and compare them with the classes shown the last three years, I marvel at the progress made. Up to this year I remember seeing or hearing of only one really well matched old pen of good quality, while this year I saw two or three so well matched that if you were to take one of the females out, when you put her back you could hardly tell which one you had handled. Up to the last three years one rarely saw even a young pen of which this could be said. Indeed it is yet rare enough to find a young pen of this quality. So good were the old pens that were shown both at Chicago and at Kansas City this year, that there was almost no perceptible break in color between young pens and old. You could walk down the line and scarcely tell where the old pens ended and the young pens began. Nothing could speak more eloquently of the amazing progress Rhode Island Reds have made in the last few years.

However, there is still plenty of improvement to be made. So, while we are busy with all the details of housing, hatching, brooding, rearing and selling, let us not forget our vision of a proudly stepping, graceful, prolific bodied bird, one solid shade of that red which flames startlingly against the green of lawn or woods or field, except where this soft lustrous red is heightened by the contrasting green black trimmings, and let us dream of breathing the breath of life into this vision of grace and beauty.

Hatch Early.

Begin now while you have time to prepare for early hatching. Get out your incubator, clean it up and see that every part is in order. If not in order, order the needed parts before you are ready to start. Disinfect thoroughly. Renovate your brooder house and brooder. See that the brooder is in working condition. If you expect to employ "Old Biddy" as an incubator, provide a special brooding room or dark shed and as fast as they become broody remove to this department, making the transfer after dark. Place a nest egg in the nest and wait until it becomes settled and determined to accept the change before intrusting the hatching eggs with her.

Unsatisfactory egg yields, low fertility, poor hatches, slow growth and development of the young stock, and many of the most troublesome poultry diseases are often due primarily to improperly located and poorly constructed poultry houses.

How To Raise Poultry For Profit

**THE NATIONAL POULTRY INSTITUTE OF WASHINGTON, D. C.
WILL MAKE YOU A SUCCESSFUL POULTRY KEEPER**

No matter where you live, east, west, north or south, if you have a backyard, a town lot, or farm acres, **YOU CAN RAISE POULTRY FOR PROFIT.** It is a matter of **KNOWING HOW**, and the faculty of this Institution—men who have given their lives to the development of the Industry, **WILL SHOW YOU HOW.**

WE TEACH POULTRY KEEPING BY CORRESPONDENCE

Each officer of this institution has served **OUR NATIONAL GOVERNMENT** as a Poultry Specialist; each has had years of practical experience in Poultry Keeping; each has a reputation as an authority on the subject. These men have first hand knowledge of conditions in all parts of the country, and the individual service given to each student in addition to the thorough, practical course, represents

WHY FEED CRY-S-CO.

99% PURE CARBONATE OF LIME.

TEN REASONS

1. BECAUSE it increases the egg yield considerably, therefore **Your Profits**.
2. BECAUSE it contains 99% Pure Carbonate of Lime which makes the shells—hard shells which means less loss in shipping.
3. BECAUSE it contains pure silicate grit, giving the hen finer plumage, and being cubic in form a perfect grinder, thereby insuring digestion of the food.
4. BECAUSE in Cry-s-co you have a perfect shell producer and grit combined, far superior to oyster shells and ordinary grit.
5. BECAUSE it means economy, as Cry-s-co goes half as far again as shells, as there is no waste, and you need no additional grit.
6. BECAUSE it promotes digestion, keeping the hens healthy, and in a great measure prevents egg eating.
7. BECAUSE it costs no more than ordinary shell or grit.
8. BECAUSE it has the hearty endorsement of many of the most prominent fanciers and poultry raisers in the U. S. Men who know. (Original letters on file.)
9. BECAUSE you are raising chickens for the results and not for the pleasure only of seeing them around or the work there is in it.
10. BECAUSE as a wide-awake poultry raiser you want better results and in Cry-s-co you will find them. Let us prove it to you.

Therefore buy a sack from your dealer today, but LOOK for the TRADE MARK on a white sack or write us for FREE SAMPLE and booklet.

HOW TO HANDLE MALE BIRDS.

By HAROLD RAWNSLEY.

Keeping male birds in condition for show and breeding purposes when separated from the hens, is often a perplexing proposition to the novice. First, let me say that a great many more male birds are ruined by overfeeding than underfeeding, so your motto should be to feed often and sparingly.

A male bird confined in a small coop cannot, of course, get the exercise that he does when in the run or on range, and consequently does not digest his food so easily; but at the same time he needs just as much, in fact more food, than when running with the hens, because we are getting him into condition for a season's work as a breeder, and the more weight and vigor we can instill into him, the better. By weight I do not mean a dead weight. Male birds can easily be made too fat for breeding purposes, and one I consider in condition for the breeding pen is a bird that has lots of good hard flesh on him, with bright eyes, good red color in comb and wattles, a high sheen on his plumage and when you pick him up he does not feel a dead weight, but is corky.

My method for keeping male birds in this condition is as follows: Their first feed in the early morning consists of whole oats that have been soaked in water over night. Each bird is given as much as he will clean up in about five minutes. The next feed, at about 10 o'clock, consists of a little green feed, usually sprouted oats. About mid-day these males are fed a wet mash composed of boiled wheat, ground oats, hominy and bran, mixed with sour milk to a crumbly state, never sloppy. Each bird is fed a large handful of this. Their last feed at night consists of whole corn or wheat, or a mixture of cracked corn, wheat and oats, equal parts.

They have free access at all times to fresh water, oyster shell, grit and charcoal. Some birds, of course, require more feed than others. I watch every bird closely to see that he is digesting his feed properly and if I find one that is not, I immediately turn him out for a run and give him a tonic. I always go around between feeds and remove any food that may be left. I never give a male bird all he will eat except the last feed at night.

Male birds that are kept in good condition should always be up on their toes and ready for their feed. In one of our conditioning houses, which holds forty birds, twenty on each side, I can tell at a glance if everything is all right. At the sound of a feed bucket or a door opening, they are all alert and at the front of their coops ready for a feed. Should any of them not do this, I immediately investigate the trouble.

A little advice about the male bird after he is put into the breeding pen may not be out of place. The bird is, or should be in the prime of condition and full of pep and should be watched carefully to see that he gets his share of food, as very often a male bird will strut and call to the hens, merely picking the food and dropping it again for the hens. When you have a male of this kind he should be taken out of the pen and fed separately once a day, or he will soon get out of condition and will not fertilize the eggs. Always bear in mind that the male is half the pen and it will pay for the extra trouble it takes to keep him in condition.

Crystal AUTOMATIC DRINKING FOUNTAIN

PACKING SETTINGS OF EGGS FOR SHIPMENT.

To the breeder of poultry, intent upon serving his customers in a manner consistent with the pride he takes in his business, the problem of a suitable carrier for hatching eggs, has long been a problem. After having spent valuable time, thought and care in an effort to produce eggs that are worth real money, it is depressing to learn, when they have been shipped to a good customer, that they did not hatch well.

A hatching egg is a delicate organism. While the life germ in an egg is almost indestructible, the tiny invisible membranes that become a part of the chick itself and are necessary to its formation, are easily broken, and if the membranes are severed, the egg will not hatch. A sharp jar is all that is required to destroy the hatching possibilities of the hardest egg and the only solution to the problem of providing a suitable carrier is to secure a package which will eliminate the possibility of the kind of jar that will sever the delicate membranes.

Poultry schools, many successful breeders and egg shippers, and the majority of poultry journals now recommend the use of the round basket, as it has been found that with this kind of a package, properly packed, the chances of damage in express or mail handling can be reduced to a minimum. In fact, some of the largest shippers report that by using this type of package they have almost entirely eliminated complaints by their customers that eggs have been damaged in transit.

The user of baskets, to secure best results, must exercise care to properly pack his eggs. The best method is very simple and if followed carefully will, in the words of one breeder, "Carry eggs safely to China."

The basket should first be lined with several thicknesses of news or wrapping paper; this forms an insulation to protect the contents from sudden changes in temperature such as might result from having eggs which have been in a warm room for several hours transferred to the cold of a railroad station platform, or vice versa.

After the paper is in place, a sufficient amount of excelsior or wood wool (some shippers prefer wood wool because it is finer and softer than excelsior) should be put in the bottom of the basket to form a cushion. Each egg should be wrapped in thin paper to exclude the dust which might get into the pores of the shell, and then be placed inside a ball of the excelsior or wood wool. This ball should be set in the basket with the small end of the egg down so that the air bubble will remain in its proper position. When a layer of these paper and excelsior-wrapped eggs is finished, more excelsior should be stuffed in around the eggs to make the pack tight so that the eggs will not move when the basket is shaken—the excelsior itself is pliant enough to form a resilient airlike cushion which will prevent the destructive sharp jar. If more than one layer of eggs is necessary, a cushion of the excelsior should be put in between each two layers.

When the eggs are all packed, the basket should be filled to the top with excelsior, after which the paper lining is completed by putting paper over the excelsior. Then the cover should be firmly attached with the wire fasteners

Royal White Wyandottes

No hen that has not produced over 200 eggs per year is used in my breeding pens. They are mated to tested cock birds.

For sixteen years I have bred Standard White Wyandottes for great egg production. By careful trapnest records and matings I have been able to increase egg production each year until now I feel I can say without fear of successful contradiction I have the greatest laying flock of White Wyandottes in America.

Hart's New Brooder

My brooder plans tell how to make a brooder for 100 to 500 chicks. Use oil cook stove for heater. A child can operate it. No thermometer or thermostat needed. No burnt air in brooder room. I threw out my coal and distillate stoves when I invented this system. No overheating, chilling, worry or grief. Make it yourself. Turn any old shed into a brooder house. My directions for feeding chicks does away with all guess work—tells just how much and what to feed.

My book also contains my feed formulas and methods that saves me 25 cents to 50 cents a hen a year, and produced fourteen 300-egg hens out of 450 pullets. Other items are: Self-feeding hoppers that are wasteproof (my new idea may work on your hoppers to make them wasteproof); artificial lighting; sanitary dropping board with miteless roosts; self-cleaning nests; self-cleaning chicken crates. Wet mash mixer for 500 to 1,000 hens for \$1. No. 1 mite paint at 10c to 25c a gallon. Culling hints and valuable items on feeding. How I selected the pullets that were trap-nested at Salem, Ore.

Hart's Poultry Book with Brooder Plans, \$1.00.

Remember this—Your money back if not satisfied with the book. Over 700 sold last spring on Pacific coast. This journal guarantees this ad. You can't lose.

WHITE FACED BLACK SPANISH

COLISEUM WINNERS, DEC., 1920. I am breeding Spanish of a hardy, vigorous type, that are unsurpassed as layers of eggs that by their size and color command a premium in any market. Winners in the largest Spanish shows of the season. Now booking orders for eggs and chicks. Circular on request. **CLARENCE HEWES, 2051 Hillside Avenue, INDIANAPOLIS, IND.**

which are made especially for the purpose and are easy to attach. The shipper then has a distinctive package that will withstand much more than the ordinary hazards of express or postal transportation.

The use of the common market or chip basket is not to be recommended as ordinarily baskets of that type are not made strong enough to bear up safely under the slam and bang of shipment.

An attractive label can be made to serve as a valuable help to the shipper—it dresses up the package and can serve to identify the shipment as hatching eggs and aid in securing careful handling. To attach labels nothing is superior to silicate of soda, or as it is commonly known, water glass, which is also widely used for preserving eggs. This when applied with a brush, forms a waterproof, transparent glue and is the best cheap adhesive that can be produced for sticking paper to wood. It is also attractive to the user for the reason that it can be bought at almost any drug store. P. A. Kages.

HENS ON A SOUTHERN FARM.

Every poultry feeder, whether he keeps a record or not, wonders if the old hen that gets in the way out in the barnyard pays for herself or not. If she has been carefully handled from the time she was hatched, properly developed and nursed along by efficient feeding practices, there is nothing on the farm that affords a greater income for the amount of money invested in her upkeep than the hen. On the other hand, if she has been neglected and allowed to seek an existence for herself, or been permitted free range during the winter, and has not been cared for

in warm, comfortable quarters, she is a distinct loss to her owner.

Such a bird, if she is a pullet, does not commence to produce eggs until March. She then lays until the middle of July very well. The owner pats himself on the back and thinks he is managing his flock profitably. He does not stop to consider that it is not especially the feed that he is throwing out to his flock that causes the increased production. He forgets that it is nature, not himself, that is responsible. As a matter of fact, hens will lay during the early spring and summer on almost any ration, simply because they cannot help themselves. It is in the provisions of nature that they do so. The fact that hens will lay during the season of natural production on a scant ration is no reason for not giving them a liberal supply of feed.

Profit from the farm flock is increased largely by the egg production during the winter months, when the supply is short and prices are high. In order to secure eggs in fall and winter, the birds must be nursed along by proper feeding during the spring and summer. In other words, laying stock requires a good ration throughout the year.

Laying hens need a good grain ration. It is a common practice to feed this in the poultry house in a deep straw litter. For that reason the grain ration is called scratch feed. The more they scratch for the daily grain, the more is exercise induced. It is the energetic hen that produces eggs.

The scratch feed should be given late in the afternoon so the hens will go onto the perches will well filled crops. Generally speaking, about a pound and a half of the scratch feed is the daily requirement of every ten birds in the

flock. They hardly need feed in the morning. It is unwise to fill the hens with a grain ration early in the day, for they will be lazy and not inclined to exercise the balance of the day.

Some feed a wet mash or boiled oats early in the morning as an appetizer, but unless one has had considerable experience in feeding correctly for egg production, he had better confine his practice to hand feeding of a scratch ration in the regular afternoon feed.

Cracked corn has always been a valuable scratch feed for hens. Many feed nothing but corn, very often throwing it out from the crib. This is not a good practice. Corn should be supplemented by one other grain, either wheat or oats, or both. When oats are fed, care must be taken that they are of good quality.

Supplement With Mash.

Scratch feed alone keeps the hen in a healthy condition and creates sufficient energy to take care of the body needs, but does not supply enough of the proper nutrient to make eggs. For this reason every flock should be fed a dry mash. It is the egg building agent of the daily ration. The scratch feed is thrown out to the bird by hand, but the mash is before them all the time. Self-feeders for the dry mash save lots of time. The hoppers can be filled once a week. Each hopper should be large enough to hold twenty pounds of mash. The ingredients in the dry mash depends upon the amount of ground feed available. We have fed farm hens one which consists of three parts by weight of bran, three of shorts, and one and a half of tankage. Such a mash is palatable, is easily mixed, and contains enough animal food to make it an efficient egg producing mash. If plenty of

MRS. NEZE WILLIAMS, :: Danvers, Ill.

meat scraps are on hand they can be used instead of tankage. Sour milk is also an excellent means of supplying animal food to laying hens. When milk is fed it is given in open pans. It is then unnecessary to feed the meat scraps or tankage in the dry mash, but the bran and shorts must be fed.

As a rule, farm hens will consume about one-half as much mash as they do scratch feed. To increase their consumption of mash, so they are eating as much mash as they are scratch feed, feed more lightly of the scratch.

Fresh water is fully as important as the feed. It should be placed in an open vessel where they can get it every time they want it, and in hot weather fresh water should be put before them twice a day.

Successful feeding resolves itself into reducing all factors to as simple a basis as possible. It requires clock-like regularity in giving the scratch feed and watering the birds, and a well filled dry mash hopper. It calls for a close study of the hens themselves. If they are not active and continually scratching in the litter, there is usually something wrong with the feeding practice. Above all, the flock should not be pampered or subjected to a new-fangled notion in chicken feeding. Aside from the requirements that have been mentioned, all the laying hens need is a supply of oyster shells, to manufacture eggshells, and a supply of limestone or other grits to help the hen grind the feed that she consumes.

Tennessee.

A. A. Howell.

BETTER FARM POULTRY.

Eggs are eighty-five cents per dozen in Little Rock and hard to obtain. They are one dollar and twenty-five cents per dozen in New York. Are you supplying a part of these "Golden Eggs"? If not, it is your own fault—and should I visit your place I could readily point out your fault. I point them out every day.

For example, recently in company with a county agent, I visited eight farms in one day, having been solicited to come and cull their poultry flocks because they were getting no eggs. On seven of these farms I found practically the same conditions. They were maintaining an average of seventy-five hens and collecting an average of one dozen eggs per day. A few had poultry houses and collecting an average of one dozen eggs per day. A few had poultry houses of the "make shift type," two-inch cracks on all sides, roosts of the ladder type, reaching from the front entrance to the eave of the back wall, thus covering the entire floor area, which was from two to four inches covered with droppings. The flocks had no quarters in which to spend the cold, wet days. The feed consisted wholly of corn and in many instances was fed from the back kitchen door. There were but few of the hens classed as culls. As for egg production, eighty percent of them were capable of producing under proper management and with the proper feed. On one farm I found conditions quite different. Would that every farm in Arkansas should apply such methods. We could laugh at the low prices of cotton and other products.

I found on this farm a modern house, fourteen by forty feet, open front, shed roof, facing south. The perches were

"SUCCESS" WHITE LEGHORNS

Cockerels, Pullets, Setting Eggs and Baby Chicks For Sale.

Our stock is all 270 and 280 trap-nest egg strain. Write for 1921 catalog.

SUCCESS POULTRY FARM, Jos. Mertens, Mgr.
Crowell Ave. FORT THOMAS, KY.

arranged on a level with the droppings boards. The floor was dry and covered with oak leaves to a depth of twelve inches and one hundred and twenty-five busy hens were working hard at sunset in an effort to fill their crops before bedtime. I assisted the good wife in collecting sixty-two fresh laid eggs, a reward presented by this happy flock for good treatment. I found four pans containing buttermilk under a shed. I had seen enough and I was sure the eggs could be found.

We should like to see a flock of uniform Standard poultry on every farm and shall not consider our mission a success or complete until this is accomplished. Not until then can we expect to demand the top price for our products in competition with an A-grade standard uniform of products. However, the world was not made in a day, so a right step in that direction is the next best thing. Dispose of that scrubby, scaly leg, narrow bodied, dung-hill, knocked-kneed rooster and get a Standardbred Plymouth Rock, Rhode Island Red, Orpington, Leghorn or any good utility, vigorous bird and you will be so well pleased with the improved fryers, pullets and eggs produced next year that you will go the whole thing another year with an exclusive flock of good birds.

H. B. Lansden.

Arkansas.

An Experience With Ducks.

To secure a successful start in duck-raising I would advise beginning with mature ducks, using three to five ducks with one drake. Buy early before the breeding season so that the stock may get accustomed to the change. Try to get ducks at least one year old; ducks less than one year old hatch weak undersized ducklings. Weak ducklings are due to either overfat, under-matured or too closely related breeding stock. Run the breeders on the range and they need little feed or attention.

Some people seem to have good success when their ducks have only enough water to drink but I think the ducks mate better and the eggs are more fertile with a body of "live" water. Thousands of ducks have been raised successfully without water to swim in, still water is very beneficial, especially for the breeders.

Cover the floor of the coops with straw as the ducks like to cover their eggs after laying. Keep the ducks in till nine o'clock or they may drop some of their eggs in the water.

Our ducklings are hatched by hens, each hen receiving eleven eggs. We put a sod in the nest and sprinkle the eggs occasionally. See that the brood coops are plenty large enough or the duck will kill many during the early mornings. Do not allow the young ducklings to get wet, even though they enjoy doing so.

The first feed is rolled oats and bread crumbs moistened with milk, also a little sand for grit. Milk or cottage cheese is a good starting food. Place the water nearby so that they can wash down as they eat. Later we feed a mash made of two parts wheat bran, two parts middlings, and one part gluten with plenty of cut greens. This is fed moistened in troughs that are two inches high with slats nailed upright to keep the ducks from getting in on top of their feed. When the ducks are fully

Attention Please!

WILBUR'S Columbian Plymouth Rocks

FIRST PRIZE COCK
Madison Square Garden, New York, 1919.

A Worthwhile Consideration

If you intend to keep a backyard flock or stock your farm with poultry for commercial purposes isn't it worth your consideration to select a dual purpose variety that is profitable, practical and beautiful?

WHY PROFITABLE? Because my Columbian Rocks are prolific layers of large, uniformly well-shaped eggs, therefore insuring a satisfactory profit over the cost of food and care. Broilers, fryers and roasters of this variety are the most palatable, quick-growing, soft-meated, plump-breasted, yellow-skinned kind, which command ever ready sale in any good market at premium prices.

WHY PRACTICAL? The chicks are hardy and develop rapidly when given just ordinary care. The pullets mature from five to seven months of age as per care, food and growing conditions. All told, they are a naturally vigorous, active fowl, yet always contented and with a special instinct for adopting the high-egg production habit, whether closely confined or on free range.

WHY BEAUTIFUL? The distinct, strongly-contrasting black and white markings on the shapely Plymouth Rock form present an artistic appearance to please the most critical observer, and they will grace the lawn, field or yard of any private estate, farm, village acre, back lot or commercial plant.

Come To the World's Headquarters

for absolutely the best on earth of this combination Eggs, Meat and Beauty Breed—the Columbian Plymouth Rocks. Facts talk, and here are my winnings at the great New York and Boston Shows, 1919-1921:

New York, 1919—1, 2 cocks; 1, 2, 3 hens; 1, 2 cockerels; 2 pullet; 1, 2 pens. Boston, 1920-1921—1, 2, 3 cocks; 1, 2, 3 hens; 1, 2, 3, 4, 5 cockerels; 1, 2, 3, 4, 5 pullets; 1 old pen, and 1 young pen.

P. F. CLARDY

Box A

ETHEL, MO.

feathered they are allowed water to swim in.

Ducks do not fatten well when confined during warm weather. During cold weather they are less restless for the water. I try to get my ducks to market a few weeks before the holidays as the demand and price are then better.

A few practical pointers which may be of some help to the beginner are:

Do not feed ground oats to young ducklings, as they get crop-bound.

Sometimes a young duck will swallow a green corn cob, in which case gently work the cob up the throat and out.

I have small houses on skids which I

place near potato fields or harvested grain so that the ducks can clean up the potato bugs and waste grain.

Keep an eye open for Mr. Mink, or your ducklings will disappear rapidly.

A hand feed cutter is handy to cut up such greens as mangels, radish, lettuce, etc., but garden greens may be thrown on the water, to the enjoyment of yourself and the ducks.

The sooner you can change from the hens to the incubator, the better. Hens either break the eggs or kill the ducklings, which amounts to the greatest loss in my flock.

Ducks seems to have few diseases.

Leg weakness, caused by damp quarters, cramps and sunstroke, are the chief troubles, and these are not common.

Success is sure to come when one knows how, even after a doubtful year of beginning.

According to Harper's Magazine, an Atlanta man asked an old darkey what breed of chickens he considered best. "All kinds has dere merits," replied Caesar, after a moment's consideration. "De white ones is the easiest to find, but de black ones is the easiest to hide aftah yo' gits 'em."—American Fancier.

At Last—No More Mites No More Lice

One of the biggest problems that has confronted poultry raisers in the past is how they could keep their fowls free from mites and lice. Countless remedies and methods have been recommended and used, such as sprays, disinfectants, powders, etc., but all of these various things have proven only partially effective. Besides, they require a great deal of time and attention,—annoying both to the poultry raiser and his fowls.

Probably no other thing that the poultry raiser has to contend with means as much in the way of lost profits through reduced egg production, hindered growth, quality of meat, etc., as these blood-sucking, profit-reducing pests—mites and lice.

CORONA Mite and Lice Proof PERCH

will solve this question for you, once and for all. Mites and lice cannot live where Corona perches are used. Mites feed on the fowls while they are on the roost, swarming over their bodies, sucking themselves full of blood, then go back to some secluded crack or crevice to await the next meal. That's where the Corona Perch gets them. The minute lice or mites crawl under a Corona Perch they are "a goner." Corona Perches have a galvanized trough underneath filled with oil. This oil soaks up through the wood so that the underneath part of the roost is always moist with oil,—sure death to mites and lice. The oil is poured into the reservoir through an opening in the top of perch; 30 minutes a year is all the time or labor required to keep roosts filled with oil—just a few minutes two or three times a year—that's all, and the question of lice and mites will not trouble you in the least, because you won't have any. Hundreds of poultry raisers who are using these Perches tell us that it is impossible to find a single mite or louse in their poultry houses. Rev. Morgan Peters says: "I have had Corona Perches installed in my chicken coop after I had given up all hope of ever becoming master of this vermin. These Perches brought immediate relief to my flock and death to the last mite. It truly does the work while chickens are enjoying their night's rest."

Corona Perches come in standard lengths, five feet long. They can be installed in any poultry house. They are very inexpensive, and pay for themselves over and over the first season. They will last a life time, as there is nothing about them to wear out or get out of order.

Write for Free Book and Prices

Fill out and mail coupon today. Tell us how many fowls you have and we will send you our lowest price on Perches needed for your flock. We will also send you a book describing Corona Perches in detail. This book is also filled with much other valuable information for poultry raisers. Don't delay,—whether you have a dozen fowls or a thousand, you cannot afford to be without Corona Perches. They pay for themselves in a few weeks. If they don't completely rid your fowls of mites and lice, you get your money back. We also manufacture Corona Wool Fat Compound for horses and cows, and Corona Balm for household use—products that are well known throughout United States and Canada.

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles should be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

FROM MONGRELS TO PURE-BREDS.

First Prize Article.

A few years ago, when I embarked on the Sea of Poultrydom, I little realized what might be achieved by diligent study and strict attention to business.

Having spent eight years of my life, previous to marriage, in office work, I knew little of the essentials of poultry raising. I started wrong, as I know now, by taking on shares a flock of mongrels. There were no buildings or fences of any consequence, and the flock itself had been sorely neglected.

I spent considerable time with the poultry, and soon learned a great many things from actual observation, and these, coupled with information from the Journals which I began to read, gave me some inspiration. I began to cull out the poor layers, and found that there were plenty of them. My main object at that time was to have a fair looking and fair laying flock of Barred Rocks, as that was, and is yet, my ideal bird. I did not then hope to own a two hundred-egg hen, or a show bird.

After culling the flock down to mostly Barred Rocks, I began to get the fever for better looking Rocks, so I finally mustered up courage to buy two settings of eggs. I raised two chicks from these eggs, and they turned out to be pullets. I felt a little discouraged, yet the next year I ordered again two settings from the same breeder. This time I succeeded in raising three pullets. No fault of the eggs, however. The three purebred pullets were enough to better convince me that I should buy a good male bird. I had considerable difficulty in convincing the other side of the house that we needed such a bird, and in fact, I do not believe that task

was accomplished until the arrival of the young fellow, when his beauty dispersed all doubt.

From that time my aim and object in poultry raising was to get better stock, both for egg production and beauty. I found it required hard work, study and ambition to accomplish what I desired; but if it were a simple matter there would be no use trying, for there is no interest in things that come easy.

I advanced to a certain point, and it seemed I could not get farther. I knew it could be done, for many others have done it. I spent all the time I could, reading poultry books and papers, and attended poultry shows and poultry short courses at our state agricultural college. I finally decided that what I needed most in my flock was a male with strong blood lines. I immediately purchased a male from a reliable breeder at a fairly substantial price, which proved a credit to my flock. I am fully convinced that one good male will do more good in one year in building up a flock than several mediocre ones can in several years. In fact, we will not get anywhere unless we use good foundation stock. Had I purchased a trio of good purebreds when I started, instead of trying to build up the mongrel flock with the average male, I would have reached the goal much sooner, and at less expense.

It pays to buy the very best you can afford, whether stock or eggs, and buy from a reliable breeder. I have purchased eggs at such seemingly high prices that I was afraid to tell what I paid, for fear people would not believe me, or would say I was foolish. At the same time I purchased eggs from another breeder, paying about one-third

(Continued on page 250)

COSH'S Barred Rocks

Hundreds of magnificent birds, rich in the same blood lines as our great Trenton winners, are now ready to go into the show room or breeding pen for you and produce results.

We are offering grand scientifically mated trios at \$35, \$50, \$75 and \$100 a trio, and pens (one male and four females), at \$50, \$75, \$100, \$125 and \$150 a pen.

Grand breeding males at \$10, \$15, \$25, \$35 and \$50 each, and females at just one-half these prices. Or we will mate them in numbers to suit your personal needs.

Order immediately, while our line is still complete.

Book Hatching Egg orders early to insure prompt shipment.

Ironclad

THE IRON COVERED INCUBATOR

**We Give
30 DAYS
Trial**

Because it is a tried, proven, guaranteed machine, and my special offer of an Ironclad Incubator and roomy Brooder for only \$19.75—freight prepaid east of the Rockies, is undoubtedly the greatest bargain Incubator offer of the season.

150-Egg Incubator—150-Chick Brooder

When an incubator is made of materials like this it gives you the strongest, most durable incubator that can be made

—a machine that will not warp or shrink, or open up at the seams, as every joint is lapped over with our galvanized iron covering—giving you a machine that will last a lifetime. Don't class this big, galvanized iron covered dependable hatcher with cheaply constructed machines. Ironclads are not covered with cheap thin metal and painted, like some do to cover up poor quality of material.

Ironclads are shipped in their natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad specifications: Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering. Galvanized iron legs, large egg tray, extra deep chick nursery—hot water top heat, copper tanks and boilers, self-regulator, Tyco's Thermometer, glass in door, complete book of directions, and many other special features fully explained in free catalog. Write for it today or order direct from this advertisement and save time.

Williamson Farms S. C. White Leghorns

Home of the Hen With Business Qualifications

THE ACME OF SHOW QUALITY AUGMENTED WITH THE GREATEST UTILITY ABILITY

Here on my farm you will find a most select Exhibition and Laying Flock. A strain conceived from blood of America's greatest breeders. My matings this season have been most carefully selected, both males and females being one-half pound or more over weight to meet the new requirements. A welcoming feature of this new strain is the extraordinary large white egg and lots of them. At our recent show I won 1st, 2nd, 3rd, 4th Cockerels; 1st, 2nd, 3rd 4th Pullets; 1st, Young Pen, and three specials and in competition with a well known breeder. (No old birds shown.) Judge Stanfield says, "Your string is one of the best I have seen this season, and I have judged some mighty high class Leghorns. They are good enough to show in big company." I now offer you eggs from the very latest in Leghorn excellency at introductory prices: Pen No. 1, \$7.50 per 15; Pen No. 2, \$5.00 per 15; Pen No. 3, \$3.50 per 15. Sales flock \$2.00 per 15, \$10.00 per 100. I affirm without qualification that these prices, stock considered, are the lowest of any reputable breeder in America. Order from this ad. or write for my descriptive mating list. Tells all about my stock and a line or two about myself.

America's Foremost Breeders of Hens That Lay

Box A

Lancaster, Pa.

28 Idle Hens Now Lay 27 Eggs A Day

And This Was In Cold Winter
weather. Plan Is Simple.

"I fed Don Sung to my 28 hens that were not laying. But they are laying now. I receive as high as 27 eggs a day and never less than 22."—Mrs. Jennie Davidson, Yates Center, Kan.

Mrs. Davidson wrote this letter in February. Figure her profit on two dozen eggs a day from hens that "wouldn't lay." We'll make you the same offer we made her. Here it is:

Give your hens Don Sung and watch results for one month. If you don't find that it pays for itself and pays you a good profit besides, simply tell us and your money will be cheerfully refunded.

Don Sung (Chinese for egg-laying) is a scientific tonic and conditioner. It is easily given in the feed, improves the hen's health and makes her stronger and more active. It tones up the egg-laying organs, and gets the eggs, no matter how cold or wet the weather.

Don Sung can be obtained promptly from your druggist or poultry remedy dealer, or send \$1.04 (includes war tax) for a package by mail prepaid. Burrell-Dugger Co., 214 Columbia Bldg., Indianapolis, Ind.

America's Most Popular Poultry Magazine

4 MONTHS' TRIAL 20 cents
60c FOR 1 YEAR \$1 FOR 2 YEARS

The one poultry magazine for the fancier and commercial poultryman. Gives complete awards of leading shows, and treats on all phases of poultry raising—a Journal for the "back-lotter" as well as farm owner. Stamps accepted. Everybody's Poultry Magazine, Box 286, Hanover, Pa.

as much for them. The chicks were all hatched same day, raised in same flock, with same feed and care, and when they matured I could not sell the stock from the cheaper eggs for breeding purposes, while the others sold readily. Even the amateur could see the difference.

If you have good birds, do not be ashamed of them. If you hesitate to put them in competition at the shows, there must be something wrong with them, or you. Suppose they do not win. All cannot win. When I first exhibited my birds, I was laughed at, and told I could not win, and that it would hurt the sale of my breeding stock. I won the blue ribbon. The next year I tried again, with better success, winning the blue and the red. No amount of advertising will convince people you have good birds like putting the birds before them. I received many inquiries as to how I made them look so nice, and why their birds did not look that way. I told them it was due to good breeding. This created a demand for the breeding stock which I had for sale.

The human eye craves beauty. All the world craves beauty, even Nature. Then cannot beauty and utility go hand in hand? This is what a customer really wants in a bird, though he may tell you he does not care for fancy points, "just wants something that will lay." But give him his choice, and he will select the best shaped, best bodied, best plumaged bird you have, regardless of "lay," and in most cases, he will get the "lay" in the bird he has chosen.

From my experience in trapnesting I know it is not the worst looking nondescript hens that do the most work. On the contrary, the hen of beauty is the hen of duty. Mrs. Frank J. Oliver. Indiana.

FRIED CHICKEN OUT OF SEASON.

Second Prize Article.

Do you like chicken fried better than when prepared in any other way? If so, you can sympathize with me, for my family as well as myself has a very well defined appetite for fried chicken. They want it not only during the natural fryer season of spring and summer, when the surplus cockerels are being swatted, but also in the fall and winter, in fact they want fried chicken the year round, and the one specification is that it be tender.

This, you will say, is a large order, and would seem to call for hatching at all seasons of the year. This, however, would be impossible in our climate; so after telling you the circumstances under which I began to keep chickens, which developed the above demands, I will tell you how I solved the problem.

My first buy was from a neighbor, a dozen so-called Barred Rocks which were supposed to be yearlings. They were at least a year old, and when boiled, the gravy was tender if the meat was not. We next acquired a farm flock, which also failed to meet requirements, it being composed of seven different sizes, varieties, and ages of fowls. After boiling an old Leghorn hen for several hours without results, we sold the rest to the butcher and vowed that in the future we would never eat anything but fryers.

Book

The American Breeds of Poultry By FRANK L. PLATT

This new book, published 1921. Up-to-date in all particulars. 256 pages. 100 illustrations. Printed on enameled paper. Bound in brown cloth. The most elaborate and costly book we have ever published.

This is the only exclusive work ever offered to the public on the great dual-purpose breeds that have been made in America by the genius of American breeders. An entirely new text, in which the author goes back to original sources, and starting at the beginning writes a history of the American breeds, tells of their origin and traces each step in their development. Every detail on the proper mating of each variety is given in a plain, practical way.

Only a few of the general subjects are:

Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualifications of a breeder; Work of the breeder; Building a strain; Inbreeding; Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting.

No matter what breed of chicks you raise, whether English, Mediterranean, or American, you will learn much to your advantage.

Price, Postpaid, \$2.00

AMERICAN POULTRY JOURNAL
523 Plymouth Court Chicago, Illinois

We are at present raising Rhode Island Reds, and are very well satisfied with them. However, we do not like to kill the young ones until they get their final feathers, by which time it is safe to cull them for color. So our problem of fried chicken was still with us, until we evolved a method of cooking which will make a delicious fry out of a five or six months' old cockerel or a hen which is too old for profitable egg production or breeding. This method is as follows:

Dress the chicken and cut it into pieces in the usual manner, cutting the breast in two if the bird is large. (We cut the breast crosswise so as not to break the wishbone). Roll each piece in flour that has been salted and peppered. Put a good sized lump of butter in a hot skillet, let it brown, and then put in the piece of chicken. Cook either quickly or slowly until they are well browned on both sides, then transfer them to a steamer and steam until tender, which will take from one to two hours, depending on the age of the bird. When tender, put the pieces back into the skillet, which has been saved from the first frying, and crisp well, when they are ready to serve.

If gravy is desired, as is usually the case, remove the chicken from the skillet to a warm platter in the warming oven, and add enough flour to the skillet to take up the grease, browning the mixture, and then adding milk and the fat and juice which steamed out of the chicken while in the steamer. Salt, pepper, and boil as for any gravy.

I will not try to describe the results of this method—the crisply cooked skin, the moist tender meat, and the luscious gravy, but will leave it to the lovers of fried chicken to try it for themselves when a young fryer is desired but only an older bird is available. H. R. Reed.

Washington.

RETAILING DRESSED BIRDS.

How do you weigh and mark dressed broilers for retail trade?

This question puzzled me for a year. With a retail trade it is necessary to tell how much a bird weighs and costs at a moment's notice. If the basket you were carrying had fifteen broilers in it and a person asked for one that weighed two pounds, the poultryman was up against it.

Two years ago I met the issue by tagging the birds with cards. A card with a string was attached to the bird's leg and the weight written on the card. I spent most of the season looking for the tag that this or that bird had lost. When it came to this spring I said, "never again."

My solution was suggested by the system of toe-punching. Every bird has eight toe-nails, four to a foot. Therefore on one foot pounds were to be marked while on the other the quarters were to be registered. As I put a broiler on the scales I took a pair of scissors and clipped a bit off the toe-nails to denote the weight.

To illustrate: Suppose the broiler weighed two pounds and a quarter. As I said above, one foot denoted pounds and the other quarters. In this case then I clipped the middle toe-nail of one foot (it was the second nail from either side and could mean only two). The quarter pound was marked by clipping the first toe-nail on the other foot. If the weight had been two pounds and a half I would have clipped the first

Globe Incubators

Made by a practical poultryman

Globe Incubators are made to hatch, because early in our experience in operating a large poultry farm we recognized that an incubator which would give good hatches would be a great help. We found that a great many on the market were made to sell rather than to satisfy the purchaser. Our facilities for studying natural incubation were the most favorable for poultry raising was our only occupation. From these studies and the development of them we evolved

A PERFECT

Incubator & Brooder

Machines that were dependable, because self-regulating and automatic in the most vital operations. Machines that are not simply "good enough," but **absolutely good**. They have every necessary appliance, but not an unnecessary piece, and the prices are reasonable. They are machines to which you can trust the most expensive eggs and chicks without the least fear.

THOROBRED POULTRY

Shoemaker Poultry Farm is one of the largest breeders of Standardbred poultry in the world. We raise 48 different breeds and varieties of fowl. Egg record, Leavenworth, 214; Mountain Grove, 229. 2,000 chicks growing. Best Buff Rock catalog ever issued FREE. C. R. BAKER, Box A, Abilene, Kansas.

An "Aristocrat" Barred Plymouth Rock Cockerel. Owned by W. D. Holterman, Box A, Fort Wayne, Ind.

and second nails on the quarter foot, the pound foot, of course, remaining the same. In so many words the foot that marked the pounds would never have more than one nail clipped. If it was the outside nail it would be one or three pounds, the middle nail two pounds, and the back nail four pounds. On the quarter foot there would be one, two, or three nails marked depending whether the fraction was a quarter, half, or three-quarters of a pound.

The only chance for confusion is between birds weighing three pounds and a quarter and a pound and a quarter, because in these cases outside toe-nails would be clipped entirely. My answer to this is that you will have no trouble distinguishing between such birds. Whether the outside nail meant one pound or three is a question that will never confuse you if you handle a few birds.

In fact there is only one real objection to the marking of birds in this way and that is missing toe-nails. This made me almost give up the system before I ever started. Just think! Here are chickens scratching all day long. It must be very hard on the nails. Well, I had to do something. So I went ahead. In all I marketed about 500 broilers all marked according to this system. Out of 4,000 nails thus gone over, I found one missing and that came in just right to tally the bird's weight and saved the scissors.

In conclusion I might say that this same method could be used for fowls and other heavy birds. All that would be necessary would be to take a minimum weight and use your weights and fractions for the birds above this weight. Such a standard would have to be set low enough so that no bird would come under it. This would be very simple inasmuch as nail marking could be made to show five pounds above your standard, and no one class of birds would be apt to show so wide a variation. L. Harris Hiscock.

Shortage of Pedigreed Males.

The chief obstacle in the way of getting the new certified poultry breeding project into operation as outlined by the University of Missouri agricultural extension service is the scarcity of high class breeding males with a definite egg record back of them. Nationwide inquiry has failed to locate in some of the popular varieties of poultry a single available cockerel which can be sold with a guarantee that the mother of the bird laid more than 200 eggs in one year. In only one variety, the White Leghorns, is there anything like an adequate supply available of pedigreed high egg strain males. The farm flock owners who have Brown Leghorns, Buff Orpingtons, Minorcas and Anconas have been unable to locate 200 egg strain males, and any breeder who has well matured cockerels of any of these breeds which are the sons of hens with a reliable trapnest record of more than 200 eggs in one year will confer a favor by getting in touch with the poultry section of the agricultural extension service of the University of Missouri at Columbia. Those interested in the certified breeding are willing to pay a good price for birds with reliable records. This shortage of the kind of breeding males which every flock owner should strive to secure, points out the need of more attention to egg records on the part of commercial breeders.

DISQUALIFICATIONS AND FAKING.

By E. H. HOFFMAN, Poultry Judge.

Every show season brings up the same problems with reference to disqualifications and indications of faking, which are not only disagreeable to the judges but oftentimes to the management of the show in which they arise. It is a simple matter for a judge to disqualify a bird when the case is clear-cut, but when a bird is found having indications of an attempt to cover the disqualifying defect, then trouble often results and in some cases charges are made against the exhibitor and sometimes again the judge. When a bird is disqualified for any one of the more serious defects, such as stubs, side sprigs, white in the face of Mediterranean cockerels or pullets, squirrel tail or wry tail, the owner can easily see the fault after the judge points it out, but even then there are some who dispute the decision of the judge. There can hardly be any misunderstanding about a stub if it is visible, but occasionally we find birds that have holes in the sides of their shanks where the stubs had been pulled out, and cases have come up where the holes had been plugged with beeswax. It is far better to leave the stub and have the bird disqualified than to remove it and fill the hole, with the intention of putting one over on the judge. Wherever there is any indication of stub or stubs having been removed, the careful judge will investigate, and should it be found that the holes are plugged, the judge has the right, and he should take advantage of the power, to throw out the entire entry of that exhibitor.

Next we come to side sprigs. This defect, like stubs, is plainly seen, but there is often a difference of opinion regarding it. Sometimes we find a comb that widens at the end of the blade and at first may appear like a side sprig, but upon closer examination there is no growth on the side of the comb which would warrant the bird being disqualified. In all cases of disqualifications the bird should be given the benefit of the doubt.

White in the face of Mediterranean cockerels and pullets is another disqualification upon which there is sometimes a difference of opinion. What is white, and where does the face begin with reference to the ear lobe? Some claim that a little white along the edge of the face under the ear lobe is not a disqualification, because they say it does not appear in the face. Our interpretation of the term "face" is all of that portion of the side of the head that is red, and the red should extend clear under the ear lobe. Any white extending out under the ear lobe is white in the face, and the bird showing it should be eliminated from competition. In my judgment there is no disqualification of more importance, when the breeding qualifications are taken into consideration, than that of white in the face. When this defect is once bred into a flock it is a very difficult matter to breed it out, and therefore all birds showing it should be disqualified.

Give Birds Benefit of Doubt.

Squirrel tails or wry tails are not uncommon in the show room, and some birds develop this defect after

being cooped. How many times do we hear it said: "That bird was all right in the yard, but he poked his tail up since he was brought to the show." This may and it may not be true; but it makes little difference how he carried his tail in the yard, for if it is squirrel or to one side in the show room he must suffer the consequences. The judge must judge the birds as he finds them, and not as they may have been a week previous to the show. Realizing, however, that there is a possibility of birds, through strange surroundings or becoming frightened, having a tendency to carry their tails unnatural, it has always been our policy to give the bird every possible chance before disqualifying it.

For instance, when the judge begins to poke his judging stick at a bird, and it is seen that it becomes flighty, it is good policy to leave that bird alone for a few moments and give it a chance to become natural. I have often passed on to the next bird, and in five minutes or so returned to the coop to see if the bird was really squirrel tailed or not. I do not believe in being too hasty in disqualifying birds, but give every one an equal chance. There is no glory in it for the judge to disqualify a bird, but on the other hand it is rather disagreeable to be obliged to throw out a good bird because of a disqualifying defect. In this connection let us say that exhibitors should look over their birds very carefully before sending them to a show and thereby avoid showing specimens that are disqualified.

Now we come to the question of "faking" over which there has been so much said. Many people misunderstand the difference between fitting a bird for the show and faking. In fitting is meant conditioning. Barred Plymouth Rocks often have black feathers and some that are irregularly barred. Laced varieties have feathers that show mossy centers, and the same is true in penciled varieties. In such cases it is not wrong to pull a few of the feathers and thus improve the appearance of the bird. This is not considered faking, and no one who follows this practice has ever been accused of being crooked. Washing white birds is a part of conditioning, but some exhibitors have been accused of bleaching and using acids to whiten the quills. This is wrong, and may be termed faking.

Dyeing plumage, trimming wide sprigs, pulling stubs, cutting points out of single combs, coloring the shanks, splicing tail feathers and bending down tail feathers are all things that come under the head of faking, and if discovered in the show the judge should not only throw out the bird that has been tampered with, but should disqualify the entire exhibit of the person to whom it belongs. It takes some nerve to do this, but I believe if an example were made of some of these overly ambitious exhibitors it would soon put a stop to the practice.

Breeding Standard poultry is a business that appeals to people who like it for the pleasure they derive out of it. They enjoy mating their birds, and there is fascination in the effort to produce specimens as near Stand-

103-DEGREE INCUBATOR

THE 103-DEGREE INCUBATOR

Hatches everywhere, strong, healthy chicks that will live, because of many new patented improvements.

The Most Wonderful Incubator Invention Ever Thought Of

The *Tilting Chimney*—biggest incubator improvement in years—controls the heat before it enters the boiler, not afterwards. Impossible to overheat or underheat the eggs—guaranteed 103 degrees all the time. No need for an incubator cellar, any room will do. No fuss or worry, no getting up in the night, only one regulation. Guaranteed fully automatic.

Patented Two-Circuit Hot Water Heating System

The first really effective hot water heating system. Every cubic inch of the egg cabinet always at the same even temperature. Forces the water to keep busy every minute, no hot spots or cold spots.

Perfect Ventilation Guaranteed

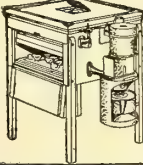

The combination of the *Tilting Chimney* and *Two-Circuit Hot Water Heating System* makes it possible to thoroughly ventilate every part of the egg cabinet at all times. 103-Degree Incubators are guaranteed entirely free from odor.

Four sizes. There is a 103-Degree for every poultry raiser. 103-Degree Incubators get results anywhere. Guaranteed to adjust temperature variations of 66 degrees between high and low.

ard requirements as possible. They expect to place them in the show room in competition with those of other breeders, whom they believe to be as honest as they are; that is, honest enough to exhibit them in their natural condition. When they discover that their competitor has been doing some of the things heretofore mentioned, they lose faith in the business and everyone connected with it. They begin to believe that raising Standard birds and winning at the large shows must be done through crookedness. They hear it said that there is a ring, and one must be in the ring to win.

I have heard about rings, but I have never seen one and have never taken much stock in stories about crookedness in show managements. The fact is that all these stories are manufactured out of whole cloth by dissatisfied exhibitors who start rumors about their competitors. A poultryman and exhibitor should be a true sport, and at the same time be square and honest. He should exhibit his birds in their natural condition after they have been "fitted." But if he has to win by "faking" then he is a discredit to the poultry fraternity and should be driven out of business. Let us all be good losers, show the best birds we can raise, have confidence in one another, and much of our show troubles will be ended.

Leg Weakness in Chicks.

In a recent number of the "Journal of Biological Chemistry" there was an article on "Leg Weakness in Chickens," by E. H. Hart, J. G. Halpin and H. Steenbock of the University of Wisconsin. As this journal is not very well known I thought an abstract of the article would be of interest as well as profitable to poultry men.

I think that everyone who has tried to raise baby chicks in confinement has experienced trouble with "leg weakness." Last year I kept chicks on the floor for over six weeks without this trouble developing. I was very careful not to overfeed. I also mixed a large amount of very fine sand in their mash and kept coarse bran before them all the time. It was surprising how much bran they ate. The sand and bran provided the suitable roughage or indigestible ballast mentioned in the abstract, which is as follows:

Baby chicks raised in confinement frequently develop a serious condition known as "leg weakness," which is characterized by a difficulty of locomotion with a tendency to remain squatted, a pronounced ruffled condition of the feathers, an anemic condition of the wattles and the comb, a swelling of the leg joints and a loss of appetite. Death usually follows suddenly. This disease is caused by the lack of suitable roughage in the ration, and can be prevented most effectively by the inclusion of paper in the ration in a concentration of 10 percent. The paper must be finely ground and mixed with the ration so that it cannot be picked out and not consumed. The disease is not a scurvy of chickens, for it develops when the diet contains green cabbage, clover or orange juice, if a suitable roughage is not included.

Provision for plenty of exercise and green feed is also ineffective. The conclusions are that leg weakness is related to overfeeding, with a low amount of indigestible ballast in the ration, and not to a lack of green feeds, exercise, outdoor air, or excessive feeding directly.

B. H. Kepner,
Chief Chemist for Maple Leaf Milling Co., Ltd., Canada.

[A year ago we received a letter advocating the feeding of sawdust. This feeding of "indigestible ballast" is along the same lines, and is something new.—Editor.]

Selecting the Breeding Male.

During the winter months is the time to be making plans for the spring rush. If you are in need of a male bird to head your next year's breeding pen secure him now. You will find that you will get a much better bird now than if you wait until next spring to purchase it. It is "first come, first served" with most breeders, and therefore if you wait until spring you will be forced to take what is left.

In making the selection for a breeding pen, keep in mind that the male is, by all odds, the most important individual in the pen, and especial attention must be given to his selection. A poor male bird is dear at any price. If you are breeding show birds, then it is the individual bird you must consider. In breeding for increased egg production you have more to consider. The individual should always be considered, but we must study the pedigree of this individual also, owing to the now generally accepted belief that it is thru the sons of heavy laying dams, rather than through their daughters, that heavy laying ability is transmitted.

Individually the male should possess qualities indicative of high constitutional vigor. A bird showing low vitality would be one in poor condition, undersized, with flat, narrow breast, knock-knees, long, narrow head, crow bill, dull eyes and low tail. Naturally, the reverse of these undesirable qualities will indicate the birds that should be used. The male should be fully up to Standard size for the breed to which he belongs, and good in all breed characteristics.

Whether to use cocks or cockerels will depend on circumstances. Cocks can generally be purchased at less cost than cockerels of equal quality, and may prove much better value for the money. A good male should be serviceable for four or five years if properly cared for and not overworked. To discard him at the end of the first breeding season is to make a great mistake. This is especially true if the male has proven himself to be a good breeder. If cockerels are to be used, select those that are well matured. A frequent cause of poor hatches and weak chicks is due to the use of immature birds.

When the breeders make up their minds to use male birds in the breeding pens that are from trap-nested hens with records of 200 eggs or better, they will find that the egg production of their flocks will increase very rapidly. There are many breeders today who have one or more 200-egg hens. The trap-nest is the most reli-

MITE-PROOF NESTS and ROOSTS

Sold on Money-Back Guaranty

Stenberg Mite Exterminating Nests and Roosts are sold on a season's free trial. They must absolutely rid the hen house of mites without spraying, or your money back.

Strong and substantial. Ideal for setting or laying. Built open; equipped with vermin and mite-proof sheets and powder traps.

Mite-Proof perches with powder traps which prevent mites from coming off walls or floor onto hens. Protect hens—starve the mites.

Write for catalog of Roosts, Nests and latest improved incubators and brooders. Prices reasonable—goods guaranteed.

64 BREEDS Most Profitable chickens, ducks, turkeys and geese. Choice, pure-bred, hardy, northern raised. Fowls, eggs and incubators at low prices. America's great poultry farm. 28 years in business. Send 5c for large valuable poultry book and catalog. A guide to success.

R. F. NEUBERT Co., Box 910, Mankato, Minn.

able method of testing a hen's capacity, and a trap-nest record should carry a great deal of weight when selecting breeders.

In brief then, select the bird with a broad, well-rounded breast; broad, full head; strong, medium length beak; straight legs, carried upright under the body and set well apart; an alert carriage; eyes bright and full, and a high degree of activity generally. Last, but not least, select a bird from a trap-nested pen with a good record.

BANTAMS PAVE THE WAY FOR LARGER FOWLS.

I am a high school student seventeen years of age and will graduate this year. I have raised poultry for the past five years and have won ribbons at both the Missouri and Oklahoma State fairs. I have also raised utility birds and have made them lay and pay.

Like most boys I have raised rabbits, guinea pigs, pigeons, white mice and bantams. The pigeons and chickens were the only ones I could make pay, although many people derive profit from pets such as guinea pigs and rabbits.

I have raised Partridge, Buff, Black, and White Cochins bantams, also Golden Sebright and Black Rose Combs. I found the Buff Cochins to be the best layers. At the Missouri State Fair, 1918, I won four firsts and a second on five entries on Rose Comb Blacks. At the Oklahoma State Fair, 1918, I won a first and a second on Partridge Cochins and a third on Rose Comb Blacks, also two firsts on Homer Pigeons.

Since then I have taken up big fowls and have raised only Single Comb Rhode Islands and will endeavor to tell my experiences and how I have made them pay. We live in a town of 30,000 and I have only a backyard in which to raise my poultry. I keep fifteen hens and do not keep a rooster, as I find it is much more satisfactory to buy hatching eggs:

Last year I raised over ninety springers. The eggs from the fifteen hens paid for the feed for both themselves and the young stock, so I have the young stock as clear profit.

I have never used an incubator as we have such a limited space in which to raise chickens and the Rhode Island Reds make excellent mothers. If I had more room I would certainly use an incubator.

I have an open front poultry house with muslin curtains which are let down in bad weathers. The house has a separate laying compartment and scratch pen. I feed grain morning and night and keep a dry mash before them at all times.

I believe there is no other breed of fowls that will do better penned up than the Rhode Island Reds but if I had enough room to keep a larger flock of layers I would try only Single Comb White Leghorns or Anconas.

At least once a month I clean and spray the houses, and change the litter. I clean the drinking fountains weekly.

Many people do not realize the profit and pleasure derived from a back lot flock but if they will count the convenience of having good fresh eggs and will count the springers consumed for home use at their market value, they will find that a back lot flock really pays.

Undrill Renshaw.

Baby Chicks and Hatching Eggs

No matter which you prefer—chicks or big, fertile hatching eggs, you want stock that is profitable, and that lay a liberal amount of eggs. Sunnyside birds are that kind. Thirty years of linebreeding and their records today are from 180 to 256. Get started today with one of the following varieties:

White and Buff Leghorns, R. I. Reds, Barred and White Rocks, White Wyandottes and White Orpingtons

BREEDERS

Trapnested stock, regular \$5 values, birds that will give you an opportunity to make good profits selling hatching eggs, with records of

KILLS EGGS FOR HATCHING

Many fanciers now use Egg-O-Latum, the great egg preserver, on all eggs sent to market. It prevents the all too common practice of the pirates who watch the grocery store or the egg buyer and obtain high grade hatching stock at market prices. And consumers, who understand, will pay higher prices for fresh eggs prepared with Egg-O-Latum because they know the eggs keep fresh until used, whether a few weeks or one year. Egg-O-Latum is a soft, white, cerate wax, odorless, tasteless, harmless. It is applied by first coating the palms of the hands, then rolling and rubbing the eggs in the hands. Five seconds enough for each egg—a dozen a minute. When eggs are to be sent at once to local market, wipe them well with a dry cloth. Enough remains in the shell pores to prevent hatching and keep them fresh for months.

From the Editor of Reliable Poultry Journal—"Can recommend Egg-O-Latum as an egg preservative that is economical and easy to apply and it does the work."—Grant M. Curtis.

Endorsed by National Housewives' League—"At a meeting of the Executive Committee of the National Housewives' League held Wednesday, June 19, 1918, the matter of endorsing Egg-O-Latum came up before the Committee. I have been instructed to write and say that we believe Egg-O-Latum to be a very good product and same has been passed by the Executive Committee."—Mrs. Sara O. West, Recording Secretary.

Kept Eggs Eleven Months—"I am delighted with the Egg-O-Latum and now using eggs that were packed in it eleven months ago."—Mrs. I. W. Morgan, Eutaw, Ala., L. B. 125.

From a Warm Climate—"I have tried the Egg-O-Latum and found it to preserve the eggs in good shape for more than six months." P. D. DePool, Havana, Cuba.

Keeps Good for 20 Months—"I have never used anything that came up to Egg-O-Latum for keeping eggs. I got a jar in August, 1918, and the eggs I rubbed with it are still in excellent condition to use. I was careful to turn the boxes as directed up until last spring. Since that time they have had no turning or care whatever. I consider it far superior to water glass. Lizzie H. Daniels, Simeon, Neb., Beaver Lake R. R., April 2, 1920.

A 50c jar is enough for 50 doz. eggs. A \$1 jar for 200 doz. If no dealer, order by card. Postman will collect. No extra charge. Handy as 'phoning.

GREEN FEEDS FOR POULTRY.

In the spring and summer months the farm flock has a sufficient amount of green feed supplied by the native grasses and tender sprouts of other plants. This is not the case during the late fall and winter, and for good results with the flock green feeds should be supplied in some manner.

There are several ways in which this green feed can be supplied, among which are root crops, such as carrots, parsnips, turnips, rutabagas, and artichokes, winter grains and sprouted oats. If the root crops are grown for winter feeding, they should be stored in a dry, well ventilated cellar or pit where the temperature is maintained just above the freezing point. Therefore the growing of roots for green succulent feed is not advisable, but in place of these green crops can be substituted.

The green crops which are and can be raised for poultry feeding are alfalfa, clover, peas, beans, oats, wheat and rye. Legumes are most desirable for feed as they contain a considerable amount of protein and would produce large yields. A clover or alfalfa patch close to the warm buildings provides an excellent place for the poultry to graze on during the winter months.

Oats, wheat, or rye, when planted during September, will make a fine range for the laying flock during the entire winter. Vetch can be sown with any of the above grains and will be relished by the flock. Besides supplying the flock with green feed, these winter grains act as a soil retainer and as a green manure crop the following spring. It will require but a small area to supply green feed enough for the average farm flock.

If the necessary ground is not available for range and the flock is kept in small pens, green succulence may be supplied by sprouting oats, wheat or rye. This can be done with a home-made sprouter or a bought one. The following method of sprouting grains is generally followed:

Use only the best grade of plump, heavy grains, and handle them in such a manner that they will reach maximum growth quickly. Take six quarts of grain and place them in a bucket containing ten quarts of water at not over 100 degrees F. To this add ten drops of formalin to prevent mold, let the grain soak from twenty-four to forty-eight hours, then spread out on a basement floor, or in the trays of the sprouter if one is used. The temperature of the room should be high enough to cause the grain to sprout and reach the feeding stage in about seven days. Water the grain daily, and when the sprouts are from an inch and a half to two and one-half inches in length, feed about one square inch per hen per day. If the above method is used and the trays of the sprouter are just sufficient for one day's feeding, a tray can be emptied each day and a new one started.

This sprouting of grains is advisable only when there is no space available for the planting of winter grains, or where the birds are confined during the winter months. S. R. Stout.

In order to keep lice out of the nest we would advise that you use a good commercial lice powder. If you are troubled with mites it will be necessary for you to use liquid lice paint.

Eggs That Hatch Chicks That Grow

EGGS!

THE YEAR
ROUND
FROM
RHODE
ISLAND
REDS

The Egg Type Breed

It is easy enough to get eggs when everybody is getting lots of them, but to get them when eggs are scarce and when the price is high that is what counts.

Rhode Island Reds will do the trick. They are the one breed that towers above all others as winter egg producers. They lay when your neighbor's chickens have forgotten all about it.

Rhode Island Reds are built that way — they must either lay or bust. Prof. C. W. Carrick, of Purdue University says that Rhode Island Reds are the only breed whose standard type does not conflict in any particular with the utility standard.

It is because Rhode Island Reds have the ideal egg type and because they have a heavier coat of feathers than have other breeds that they are such good all-the-year-round egg producers. Rhode Island Reds have no off season.

Why not give this wonderful breed a trial? The secretary of the Rhode Island Red Club will gladly give you all the information you desire about America's most popular breed. Write him today.

Rhode Island Red Club of America

CAN'T FREEZE VALVELESS CHICKEN FOUNTAIN AND HEATER

Won't freeze at 45 degrees below zero. Lamp keeps water at right temperature and helps keep dampness and chill out of poultry house. Every part accessible. Requires but ten seconds for cleaning. Fuel tank requires filling about every third day. Ideal for summer. Most sanitary fountain on market.

Galvanized steel. No valves to get out of order. Satisfaction guaranteed or money returned. Order from Adv. No. 6, 5-gal., \$8.00; 8-gal., \$10.00. Write For Catalog.

RIPPLEY MFG. CO., Dept. A-5 Crafton, Ill.

Winter Care of the Flock.

The most common questions sent in this month were pertaining to birds affected with colds and bleeding combs. Colds are forerunners to roup. The best prevention of colds is lots of fresh air and a clean, dry house. Have the birds roost back from the windows out of the drafts, and leave the muslin curtains open most of the time, only closing them on severely cold nights, or when the snow or rain beats in. Give the flock epsom salts, plenty of green feed and exercise. Clean drinking vessels daily, occasionally disinfecting them, and give good, clean, wholesome food. Isolate any birds showing any signs of sickness, and if a bird becomes very sick, kill and burn her rather than to try individual treatment. Give epsom salts once a month during the winter months, at the rate of one pound per hundred hens, either in the drinking water or a moist mash.

When hens or pullets are starting to lay during the fall and winter months a slight scratch on the comb will cause a great loss of blood. If the flow is not stopped the fowl will often bleed to death. An effective method to check the bleeding is to sear the torn section with a hot iron, or to cover it with colloidion or "New Skin." Remove all loose ends of poultry wire, protruding nails, or sharp pieces of tin with which the combs might come in contact.

Every one is interested in more eggs at this season of the year. The poultry flock which is expected to lay winter eggs must have inherited ability to lay which can only be obtained by hatching from high producing hens, mated with good, vigorous cockerels. The house must be clean and dry, with plenty of fresh air and sunlight. Most important of all, they must be fed a ration which furnishes the proper material for making the eggs. The easiest method of feeding laying hens is by the use of a dry mash. There is probably no one best egg producing mash, but one thing is certain, it must contain meat scrap. The following dry mash has been found to be very satisfactory, and if fed in combination with the common grains that are produced on the farm, will produce results: 100 lbs. corn meal, 100 lbs. wheat middlings, 100 lbs. wheat bran, 100 lbs. ground oats, 100 lbs. beef scraps or high grade digester tankage.

At this season of the year, hens should be eating two-thirds as much mash by weight as they do scratch grain, or, roughly speaking, about equal parts in bulk. H. D. Munroe.

Orpington Type.

Several Orpington men were talking together at Boston. Wid Card remarked: "The Orpington is a big bird, with a long keel, and can carry a great deal of size." Said Richard Oke: "I have always been against that excessive fluff."

Said A. C. Robertson, proprietor of Robadel Farm: "The best layer on our farm was the 1st prize White Orpington pullet at the New York show last year."

"There you have it," said Oke, "she was a smooth feathered bird."

Continuing, Mr. Robertson said: "We have no shade, and yet we have not twelve white males that show brass. Drevenstedt has been there." And Dreve added: "Yes, that's right."

MODERN IDEAS IN POULTRY CULTURE.

By T. H. HOLMES.

In these modern days of mammoth incubators and of commercial hatcheries accepting orders the previous year for shipment of tens of thousands of baby chicks to be delivered on a certain date the following spring, it behooves the modern poultryman to count his chickens in the most scientific way possible.

In Cleveland, Ohio, there is a little old abandoned church that has been taken over by the inventor and changed into a big, mammoth machine, and every nook and corner of it forms some important part of the incubator. There are fourteen compartments, each one a large room in itself; all heated, however, by steam from the same plant. The warmed and moistened air is forced downward into the hatching chamber by electric fans. The air is changed every three minutes and a uniform temperature of 100 degrees is maintained throughout the hatch. During the hatching season this machine requires a trainload of fifty cars of eggs, an average of two and a half carloads of eggs being set each week.

The trays in which the eggs are incubated would stretch fully four miles in length, if placed in a row end to end. The eggs of one hatch average a weight of sixty-five tons. It takes two miles of conveyor chains to bring the hatching trays through the various stages of incubation. The egg trays hang on the conveyor chains in vertical tiers. The eggs are placed in the top trays, which are moved down a notch a day, so that by the time they hatch the floor of the incubator is reached, the removal of the tray of live chicks allowing for the insertion of a new tray of eggs at the top. By this system chicks are hatching every hour of the day and night throughout the season.

"Counting chickens before they are hatched," in these days of scientific poultry culture, means taking every precaution to insure the hatching of the greatest possible number of chicks from a given number of eggs. It has been said that to properly educate a child you must start with his grandparents. Likewise, to insure the best hatch you must start with the grandparents of the hen that laid the egg.

The up-to-date poultryman keeps a close tab on the pedigree of his breeders, not merely as to fine feathers and winning of blue ribbons, but as to constitutional vigor, immunity from diseases, ability to lay many eggs, especially in the months when prices of eggs are highest.

By means of a trapnest that makes each hen that enters the nest a prisoner until released by an attendant, and by a numbered leg band which enables the attendant to identify the hen, it is possible to select for the breeding pen hens that lay well shaped, strong shelled, full meaty eggs of correct color, that lay at least 150 eggs in a year and lay at least ten eggs each winter month.

By excluding, from birth on, every sick bird and every bird that is listless and has a poor appetite, it is possible to have a flock of breeders that have the stamina, the health and the fecundity to produce fertile eggs that should hatch well.

Experiments made at various state experiment stations have demonstrated

Can I really learn the poultry business by mail?

Yes! Eleven of America's greatest poultry experts, successful both as poultrymen and teachers, have created the Interstate Poultry School Home Study Course which will give you the needed training at home.

How can I make money growing market poultry?

Let Prof. Hare show you. (Late U. S. Dept. of Agriculture and Clemson Agricultural College.)

How can I get a heavy egg yield the year round?

Harry Forster has done it and everybody knows he has. Let him tell you.

How shall I select my breeding stock?

Nothing more certain in the world. Let T. F. McGrew tell you. (Poultry breeder, judge, writer, lecturer.)

How can I prevent and control poultry diseases?

Prof. G. D. Horton will tell you. (Late Oregon Agricultural College, Missouri Poultry Experiment Station, and U. S. Dept. of Agriculture.)

What's the best method of raising baby chicks?

M. L. Chapman knows, and he has proved he knows. Let him tell you. (Supt. Wilburtha Poultry Farms, President White Leghorn Club.)

What's the difference in poultry work in Canada, the Mississippi Valley, and Florida, for example?

Let Prof. F. C. Elford tell you. (Poultry Husbandman Dominion of Canada.)
Let Prof. A. F. Rolf tell you. (Late Oklahoma Agricultural College; U. S. Dept. of Agriculture; Secy. White Leghorn Club; Editor Modern Farming.)
Let Dr. N. W. Sanborn tell you. (Prof. of Poultry Husbandry, University of Florida.)

How can I learn modern poultry methods from A to Z?

Prof. F. H. Stoneburn, Late Prof. of Poultry Husbandry, Connecticut Agricultural College; John S. Martin, one of the world's foremost poultry breeders; F. L. Benedict, expert in poultry production and marketing methods, together with the entire faculty, will teach you as they are teaching ambitious poultrymen everywhere.

Whether you are only contemplating going into the poultry business, or running a backyard flock, or are in the business on a commercial scale, you can profitably use the experience and specialized knowledge of these men. Positively you can get it all by mail. It is being done by others every day. Just one thing to do—send in the coupon below. The next mail will bring you all the evidence and full details of how we do it. (This Interstate Poultry School Course is one of the many home study courses offered by the United Y. M. C. A. Schools.)

1031 East Bremer Ave., Waverly, Iowa

certain important facts regarding the inheritance of the ability of hens to lay well. At the Maine station for a period of nine months the heaviest laying Barred Rock hens were selected each year as breeders, on the assumption that the rate of egg-laying would gradually increase; but at the end of the period it was discovered that the average had dropped from 136 to 113. In other words, heavy laying hens did not transmit their own exceptional egg-laying ability to their daughters.

Later on it was discovered that the son of a heavy laying hen may transmit the mother's wonderful egg-laying ability to the granddaughters, even through the medium of a very poor laying mother. This fact coincides with the facts regarding the transmission of milk and butter production by the male rather than the female cow. It is therefore of the greatest importance to determine the pedigree and performance record of the male birds. This necessitates considerable details of pedigree records over a period of years to determine by the performance of the daughters the fecundity and prepotency of the males. In an editorial last spring in American Poultry Journal there appeared on account of a "Proposed Kansas Cockerel Testing Station."

Trapnesting, though the surest method of obtaining accurate information as to the performance of hens, is a rather laborious operation and a time and labor consumer. During the war great efforts were made to speed up egg and poultry production, and under this stimulus certain methods more or less known before the war were given a thorough try-out and quite widely adopted by the poultry fraternity. They might be called the culling methods.

The state agricultural colleges gave courses of instruction and sent out experts to demonstrate to farmers the feasibility of several short cuts to a knowledge of which are the best layers and which are the slackers. The most pretentious of these methods is known as the Hogan system. This system consists in measuring by means of the hand the span between the end of the breast bone and the pelvic bones, the spread between these pelvic bones, and the thickness of these pelvic bones. The span between the breast bone and the pelvic bones indicates the size of the abdominal region with its capacity to hold large digestive and reproductive organs. The thickness of the pelvic bones is supposed to be correlated to the constitutional tendency of the animal; coarse bones, with a tendency to change surplus food into meat and fat; thin bones, with a tendency to change surplus food into eggs. This corresponds with the beef and milk types of cows.

The spread between the pelvic bones varies according as to whether the hen is laying at the present time or not, and so the observer is able to detect the laying hen. In line with the facts above stated, that the male bird is largely responsible for the transmission of egg-laying ability, it was a valuable discovery that these same measurements may be applied to the roosters, and by a different set of tables it may be determined what his egg-laying index is as transmitted to his daughters. As it has been demonstrated that all sons of high record hens do not have the ability to transmit their mother's productivity, so it is important that certain measure-

The Quality Line

For over 32 years, thousands and thousands of poultry raisers attribute much of their success to the use of International Poultry Food Tonic. It helps make hens lay wonderfully well and keeps poultry in the best of condition.

INTERNATIONAL Poultry Preparations

The line includes every preparation necessary to the promotion of good health, proper growth and development of all kinds of poultry.

ments of the skull may indicate the measure of the prepotency or ability to impress his hereditary characters on his offspring. Only the simpler elements of these Hogan methods were utilized by the government poultry experts. With these were several other simple rules: Best layers are—

Those whose yellow skin, beak and legs are the most bleached out at the end of the laying season.

Those that molt latest in the fall (kill those that molt in the summer).

The first off the roost in the morning and the last on at night.

Those with fullest crops at roosting time.

Those in the fall with the most worn-out and faded plumage and worn-down toenails.

The Oregon Station gives these tips—

The pullet that lays within 200 days after hatching will lay 200 eggs (or more) in a year.

The pullet that lays 30 eggs during December, January and February will lay 200 or more eggs in a year.

Points on Breeding.

In mating up the breeding pens it is of the greatest importance to observe the following:

Mating unrelated birds increases constitutional vigor and productivity. If one is not interested in maintaining the purity of a breed and is interested only in eggs or meat, very marked increase in quantity of eggs and meat may be obtained by crossing two pure breeds. The Oregon station crossed Barred Rocks averaging 84 eggs with White Leghorns averaging 106 eggs, with the result that the crossbred daughters averaged 136 eggs. Breeding together these crossbred individuals, however, would mean disaster.

Mate together only mature birds, preferably two-year-old males and females; next choice should be two-year-olds of one sex to one-year-old of the opposite sex. The mating together of immature birds results in small eggs with a minimum amount of food supply and usually low fertility and vitality.

The breeding birds should be selected in the fall, in order that their care during the winter may be conducive to high fertility and hatchability rather than to heavy winter egg production. The strain of heavy production during the winter undermines the hen's vitality, with the result that eggs from such hens give poor hatches and weak chicks. The breeders should be given a long winter vacation with only enough food to maintain health, omitting all foods that stimulate egg production; be given an abundance of green food, and be compelled to exercise vigorously by scratching for all the feed they get. The males should be separated from the females during the winter.

When hatching time comes it is necessary to give special care to the eggs intended for hatching. They should be gathered at frequent intervals during the day in cold weather to preclude their getting chilled. The nests should be kept clean and the hens prevented from running out in muddy yards, to insure clean eggs, as soiled eggs or eggs that have had the natural bloom washed off do not hatch as well as the naturally clean eggs. These eggs should be kept in a clean, well ventilated room with a temperature between 40 and 60 degrees. The eggs should be turned every day to prevent the membranes

Brood Your Chicks with a Hen

Nature-Plus has solved the brooding problem for 50,000 poultry raisers in the United States and foreign countries, and is fully capable of solving yours. G. F. Kiessel, N. Champa St., Boone, Iowa, says: "I would not surrender the right to make and use Nature-Plus for \$500." H. A. Gray, Route 2, Fennville, Mich., writes: "It is far more successful than any artificially heated brooder I have ever seen." The Nature-Plus Hover is a practical combination of your hen and our hover. It will enable your hen to brood 150 to 200 chicks as safely as she could brood a dozen without the hover. No artificial heat, no danger, no expense. Patented in United States and foreign countries. Easily made with simple tools. Plans and rights sold to users under money-back guarantee. For further information, address,

Mating and Breeding of Poultry

By **HARRY M. LAMON** and **ROBT. SLOCUM**

SENIOR POULTRYMAN
U. S. Department of Agriculture.

Ability Is Inherited, Breeding from an Untrapped Flock, Breeding from Trapped Stock, How to Mate Every Variety of Plymouth Rocks, How to Mate Rhode Island Reds, How to Mate Each Variety of Wyandottes, How to Mate All Leghorns and Orpingtons, How to Mate Every Variety in the Standard.

Successful Breeders Endorse This Great Book.

E. B. Thompson says: "The best on the mating and breeding of poultry that has ever been published and will prove to be invaluable to thousands of people."

H. C. Sheppard: "A remarkable work as it covers the ground thoroughly and efficiently."

H. B. Hark: "It will put the beginner on his feet from the very start and he will not have to breed poultry four or five years to find out whether he is right or wrong."

This is an entirely new and original work, ready for distribution. PRICE, \$2.50 PER cloth bound, profusely illustrated.

C. S. Byers: "A revelation in Standard fowl breeding with a key to the Standard."

F. H. Davey: "It should be in the hands of every person in America who breeds poultry."

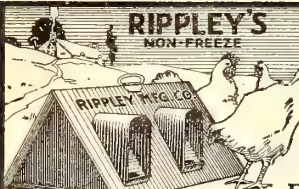

W. H. Card: "Its accuracy recommends its contents to every expert."

John S. Martin: "It covers thoroughly the perplexing points that are continually coming up in breeding."

Every breeder should have a copy. Now COPY. 340 pages of heavy book paper,

from adhering to the shell, or they should be set on their small ends, that the germ may be up next to the air cell. It is advisable to cover the eggs to prevent undue evaporation of the contents. Eggs should be set as soon as possible after being laid. From two to three weeks usually is given as the limit of time eggs may be kept before setting. In selecting eggs for hatching, all undersized eggs, all deformed or unevenly shaped eggs, all thin shelled or very thick shelled eggs, all cracked eggs, all eggs showing by candling the presence of blood spots or molds, should be discarded.

There is on the market a device that quickly determines the specific gravity of an egg when immersed in water. On the assumption that the more dense the contents of the egg, the more nourishing these contents will be for the growing chick, this will indicate which eggs will hatch and which will have a reasonable chance to live after being hatched. The distributors of this device even go so far as to claim to be able to foretell which eggs will produce roosters and which hens. At any rate, it results in saving as fresh eating eggs a certain percentage of eggs that would have had a small chance of producing healthy chicks. In a crude way our grandmothers employed this principle when they dropped eggs into a pan of cool water and selected for hatching the heaviest ones that lay on the bottom. The housewife today can in the same way identify the stale egg as the egg that floats in water.

Can Sex Be Told in the Eggs?

There have been a number of curious ideas as to a method of foretelling the sex of an egg. Many people assert that the long, slender eggs produce males, while the round, blunt eggs produce females. I have also heard these two statements:

The eggs with air cells situated exactly at the end will produce males, while the eggs with air cells placed somewhat at one side of the big end will produce females.

The chicks that pip the big end of the egg will be females, while those that pip the small end will be males. (I cannot vouch for the truth of these statements.)

After the eggs have been incubated from three to five days (according to the thickness and color of the eggshell), it is possible, by means of an electric candling device, to see the growing germ inside the egg and to tell whether it is living or dead. At three days the heart and blood vessels appear like a red spider; at five days the eye is distinctly visible as a black ball rolling about inside the egg; at seven days the outline of the body and the enclosing water bag are easily seen. An infertile egg shows a clear yellow sphere. At three days a dead germ looks like an irregular red ring. At later stages the dead germ looks black, with a cloudy, watery consistency. At the fifth and fourteenth days it is customary to discard all eggs that will not hatch, as these decaying eggs vitiate the air which is being breathed through the pores of the shell by the living chicks.

"Counting chicks before they are hatched" does not stop even with the hatching of the eggs into chicks. The same principle applies as to which chicks will live. All good breeders kill at once all the deformed, blind, crooked-toed, hump-footed, weak-legged chicks.

Why Poultry Pays and How to Make It Pay

By Morgan Bates. A "straight from the shoulder" talk on raising poultry from the money-making point of view. It gives the beginner sound advice about starting in. Covers all subjects. Price 50c.

AMERICAN POULTRY JOURNAL PUB. CO.
523 Plymouth Court Chicago, Illinois

Some go so far as to roughly topple over a bunch of baby chicks and kill any that do not quickly scramble up onto their feet. There has been much discussion as to how to tell the sex of day-old chicks, and for certain breeds it has been advertised by hatcheries that they sell selected female baby chicks one day old. The means by which they determine the sex so early is by observing a broader comb and coarser leg in the male chick. In Barred Rocks there is said to be a slightly different color pattern in the two different sexes. In this connection it may be interesting to note that some breeders claim to have controlled the development of hereditary forces so that their birds will produce as high as 90 percent of females. The method by which such a sex controlled strain of birds is developed is the same as that employed in developing a heavy layer. An application of the laws of Mendelism probably aided materially in establishing such a trait in these birds.

From the days of grandmother, when biddy hid her nest in the strawberry pile and came triumphantly clucking into the barnyard with a clutch of variegated youngsters, to this day of artificially incubated chicks with scientifically regulated hereditary tendencies, all accurately pedigreed, is a long step forward and is in keeping with all the other modern achievements of this glorious twentieth century.

DOES POULTRY PAY THE CITY DWELLER?

For so many years have I been a fancier that my friends commonly greet me with "how are the chickens?" or "how are they laying?" Others cannot understand my enthusiasm for the feathered families and ask me if my chickens pay. They seem curious to know whether my chickens are an expensive luxury or a source of income. Some seem to think I have quite an income to be able to keep so many good ones, while others wonder if the chickens are keeping me.

A few years ago certain poultrymen by skillful advertising made many people believe they could make a living with a dozen hens kept in a store box in the backyard, but these people soon learned to their sorrow that a decent livelihood is not so easily acquired. However, this very intensive system of poultry keeping did demonstrate the fact that good poultry can be successfully raised and kept in very limited quarters, provided the keeper has sufficient ambition to keep everlastingly at it, and the poultryman must be constantly on the job if he expects his chickens to pay. In poultry keeping, as in many other vocations, "eternal vigilance is the price of success."

Do chickens really pay in a city? Experiments conducted at the Wooster, Ohio, experiment farm show that hens kept in confinement are healthy and lay quite as many eggs as those kept in free range, but of course they cannot be neglected for a single day. Walk down the alleys of any city and you will see hundreds of chickens wading around in the mud and compelled to roost in dirty, damp poorly ventilated quarters. Such chickens do not pay. Such poultrymen do not deserve success.

Who will dare to say it does not pay to raise flowers, even though you never sell a single bud? The pleasure you receive from a nice bed of asters more

WRITE FOR PRICES, MATING LIST
C. P. SCOTT.
 BOX PEORIA, A ILLINOIS

Candlesby-House, R. S. O
 Lincolnshire, England.

Dear Mr. Scott:
 At the Dairy Show in a class of 115 S. C. R. I. Red pullets, the biggest class of any one variety at any show previously in England, I won first with a pullet bred here from your stock direct, third with another. H. C. and C. with two of the pullets sent, also a very neat honor. The first pullet won the Silver Medal presented by the Dairy Association for the best Red—she winning it over ninety-five cockerels and two big classes of Rose Combs, the first time a Single Comb has ever won this medal at the Dairy. The judge told me he considered her the best S. C. pullet he had ever handled. I told everyone they were C. P. Scott's blood direct and there is going to be a big run on your stock here from the inquiries I am receiving.

Yours truly,
 ED. A. CASS.

Oct. 22, 1920.

AMERICAN POULTRY JOURNAL

523 Plymouth Court, Chicago, Illinois

than pays for the effort required to produce it, and when you take a nice bunch of the flowers to decorate the pulpit or send them to the home of a sick friend you feel that you are receiving at least a 10 percent dividend on your investment. The real fancier gets just as much pleasure from a nice fowl as the gardener gets from the flower, and the things that give us real pleasure without the reaction that follows certain so-called pleasures are the things that really pay. It pleases me to be able to furnish real eggs to some of my friends who are so unfortunate as to require them, and this pleasure is an extra bonus over and above the present market price of 95 cents per dozen.

The most common cause of failure in a city or other place where the quarters are limited is too many fowls. A few well bred fowls kept in close quarters yield a handsome income, and for that reason many make the mistake of thinking they can quit work by getting a larger flock. This is where they usually stumble for it requires much skill and constant vigilance to keep a large flock in small quarters, and the most skillful poultryman cannot get as high percent of egg production from a large flock as he can from a smaller one. We sold a man a sitting of eggs from which he raised five pullets, and they average 209 eggs each in their pullet year. They were kept in narrow quarters, but the result could not be secured with a flock of fifty pullets. We recently had a flock of fifty White Leghorns that averaged 100 eggs each in March, April, May, June and July. Such results can be secured by those who have good stock and are willing to make the personal effort required in a city.

But the biggest and best income from poultry may be realized in the form of regular systematic exercise. Chickens must not be neglected, and if you have an ambition to succeed and do not trust the fowls to the care of your wife or mother, but attend to them yourself, I guarantee you will sleep better and that your general health will be much improved. Some professional men to restore their depleted supply of nervous force play golf, some go fishing and others motor into the country, but speaking from experience I believe poultry keeping superior to any of the outdoor sports as a general tonic and nerve. When things don't go right at the office or factory and you go home feeling cross and irritable, don't quarrel with your wife but go out to the poultry house, watch the fowls awhile and put things in order.

To work up this interest and thereby derive real pleasures it is first necessary to get some standard bred fowl of your favorite breed. We then recommend that you purchase a book on that breed, read it and study it and try to improve your flock each season. You can then spend much time with pleasure in observing your flock to decide which birds to select for the winter show and which to use in your breeding pens.

The next essential step is to procure a proper house. Unless your flock is properly housed your efforts will all be in vain, and sick fowls can cause you as much sorrow as anything I can think of. There are many types of houses that give good results. We recently built a Wood's house and like it very much. It is 20 ft. by 20 ft. set on posts 2 ft. above the ground to increase the yard-

MOHAWK

A winning cockerel at National Red Club Meet.

See page plate of our winning males in Jan. issue.

MID-WEST FARMS S. C. Rhode Island Reds

Established 1904

Winning Cock Birds Signify Quality That Endures

NATIONAL RED CLUB MEET, 1920,
KANSAS CITY, HEART OF AMERICA

The Supreme Test We won Fourth, Eighth, Ninth and Tenth Cocks, Fourth Hen, and Eleventh Cockerel. The only exhibitor to place more than two cocks in the classiest lot of Reds ever cooped by America's expert Red breeders.

OUR REDS have Exhibition and Breeding Quality that reproduces Exhibition and Breeding quality freely.

OUR REDS have been line bred and improved by Wm. H. Scott since 1904.

OUR REDS are one of the heaviest laying flocks of Exhibition Reds in America.

OUR REDS have iron constitutions that carry on, and without which, the best of fowls are valueless.

OUR REDS have the correct type with long bodies and full breasts with ample capacity for eggs and meat—winning type.

OUR REDS have that dark, rich color that breeds on and stays as evidenced by our winning Cock birds.

OUR REDS have firmly established family traits which eliminate so much guess work in breeding.

EGGS FOR HATCHING FROM QUALITY MATINGS READY FOR YOU

Better buy from us this year than wish you had next year. CIRCULAR FREE.

MID-WEST FARMS, C. R. Baker, Box A, ABILENE, KANSAS

YOU CAN GET MORE EGGS!

Shows Home-Made, Low-Cost Oat Sprouter, Using Little Putnam Stove.

WATER Over 90% of WATER

Therefore to make eggs and lots of them in WINTER TIME your fowls must have water to drink and plenty of it. You simply MUST keep UNFROZEN water at all times before them. ONE COLD DAY, with the water frozen and therefore inaccessible, may STOP your egg production FOR A MONTH.

A LITTLE PUTNAM STOVE will keep the water unfrozen at ALL TIMES. It holds three pints of oil and burns A MONTH with one filling. (Patented principle.) Requires absolutely NO ATTENTION, except to be filled; never needs trimming.

SPROUTED OATS To obtain the greatest egg yield you must use some form of LIVE GREEN FOOD that is abundant in Vitamins, so the scientists and investigators HAVE PROVED. Sprouted oats furnish food of this character in a LOW-COST and convenient form.

THE LITTLE PUTNAM STOVE used for this purpose, gives you the cheapest and easiest-to-operate, home-made OAT SPROUTER in the world, and it can be made in a single evening by anyone. No tools are required, but saw and hammer. The total cost, exclusive of the Little Putnam Stove, will be

less than 50 cents. I shall be glad to send you FREE my easily-followed plans for building this Oat Sprouter, also telling you how to use the Little Putnam Stove to keep the drinking water from freezing in COLDEST WINTER WEATHER. Descriptive Circular FREE on request. PRICE OF LITTLE PUTNAM STOVE \$2.00 BY PARCEL POST, prepaid to any address. References, Editor of this Journal.

SIEB'S HATCHERY

LINCOLN, ILL.

Poultry Books at a Cut Price

A complete list of poultry books that everybody interested in poultry should have. This list is made up to supply the wants of all poultrymen, and covers about every phase of the industry; in fact, it makes a complete poultry library, and by taking them all at a cut price, you will be well equipped to make a success of this business. The books tell you how to line-breed, feed for egg production, reduce your feed bill, mate to produce exhibition birds, prevent and cure diseases, mix a balanced ration, build poultry houses, poultry appliances, etc. Following illustrations show books.

Save 33 1/3%

by ordering six or more now.

84 pages. Contains diagrams of houses of all descriptions. Price 75c.

128 pages about increasing the egg production 90 per cent with the aid of artificial light—not theory but proven facts. Cloth Bound \$1.00.

11 Books \$5

A Complete Poultry Library.

128 pages. A down-to-date manual on breeding poultry. Price 75c.

Plans for houses and equipment. Everything necessary in building line. Price 50c.

128 pages, 30 illustrations. Tells how to save three-fourths your feed bill. Price 50c.

232 pages, 72 illustrations. Be your own poultry doctor. An invaluable reference book. Price 75c.

A text book for the beginner. Contains charts on line breeding. Price 50c.

Eleven Books for \$5.00

84 pages. Written from actual experience by Mr. Sheppard. Price \$1.00.

64 pages. Tells how to mate for best results. Price \$1.00.

124 pages. No matter what question arises, this book gives you the answer. Price 75c.

Every Poultryman should have a copy in which to keep his costs. Price 25c.

Cut Price for the Eleven, \$5.00; about 45c each.

This is a saving to you of one-third the regular price. If you have one or more of the above books, you can get the balance at one-third off the regular prices by ordering six or more at one time. No order for less than six accepted at reduced price. Take advantage of this liberal offer today. If not satisfied with your bargain, return the books and we will return your money.

AMERICAN POULTRY JOURNAL, 523 Plymouth Court, CHICAGO

ing space. The house is open in front being covered only with hardware cloth, and the other three sides are covered on the outside with three-ply composition roofing thus making it absolutely draft proof.

The house has a double floor with tarred roofing between the floors. The ground under the house not only increases the yarding space but furnishes at all times a nice dry place for the fowls to dust themselves in wet weather. We are enclosing the area beneath the floor on the west and south so as to protect the fowls from direct drafts of air, make the house warmer and still admit sufficient light beneath the floor. Electric lights are being installed in each of the three pens, placing a dim light and a bright light in each pen. When we desire the fowls to go on the roost we turn off the bright light and leave just enough light in each pen so they can find their way to the perches. The fowls are healthy and much more active in this house than they were in former houses with curtain fronts.

Many people in the cities never know the luxury of a first class egg. They think of a good egg as one that shows no evidence of decomposition. They have never learned that the flavor of an egg depends largely upon the manner in which the egg producers are kept and fed. If hens are fed on onions or garlic the eggs they produce will have a flavor resembling these vegetables. Likewise if hens are compelled to forage in the barn yard for their food they will produce eggs with a barn yard flavor. When these facts become more generally known there will be more chickens kept in our villages and cities.

When hens are kept in clean quarters and fed only on clean wholesome food, they produce eggs with a flavor fit for the gods. If you don't believe this just get a few layers and learn what a good egg really is. You will never be satisfied to go back to storage eggs or even to the barn yard product. I cannot understand why so many people who pretend to be very particular and are in fact hard to please in most matters, continue to eat eggs flavored with fertilizer. Does it pay to spend a little time each day to enjoy the luxury of a real egg? Try and then let me know your decision, for I am quite certain that after you learn the difference you will have good eggs or no eggs.

Yes, chickens pay in the city, like other things, in direct proportion to the patient attention you give them. Get a few standard bred fowls and care for them and study them. If you can't become a fancier so as to enjoy the presence of a few handsome fowls in the back yard, try and educate yourself to appreciate the luxury of a real egg. There is also a suggestion here for the farmer who keeps chickens, for if his fowls receive better care not only will they lay more eggs but better ones, the demand for eggs will then be greater and the price correspondingly higher.

Plenty of Drinking Water.

A hen, to lay well, should drink a great quantity of water in winter as well as in summer. Ice cold water chills the body, reduces the temperature and circulation and retards egg production. Warm the water.

CLASSIFIED ADVERTISEMENTS

UNDER this heading ads will be inserted for fifteen cents per word each month for less than three months, or *thirty-six cents per word for three months*. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under *classified headings*. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from AMERICAN POULTRY JOURNAL than from any other poultry journal—none excepted. On writing any of these advertisers, mention AMERICAN POULTRY JOURNAL. All copy for Classified Ads must reach us by the 17th of month preceding the date of issue. These Rates Void After May 20th, 1921.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

Win at the Premier Show of All the World

**Madison Square Garden
New York, January, 1920**

The Greatest Record of All Time

1st Prize and Sweepstakes Champion Cockerel at Madison Square Garden, New York 1919

Every Prize and Ribbon Offered

Cocks	- - - - -	1st, 2d, 3d, 4th, 5th
Cockerels	- - - - -	1st, 2d, 3d, 4th, 5th
Hens	- - - - -	1st, 2d, 3d, 4th, 5th
Pullets	- - - - -	1st, 2d, 3d, 4th, 5th
Young Pens	- - - - -	1st, 2d, 3d, 4th, 5th
Old Pens	- - - - -	1st, 2d, 3d, 4th, 5th

30 Prizes Out of 30 Offered

Sweepstakes Championship Male and Female and Every Special Prize. This is the crowning achievement of their unexampled record at New York for 33 victorious years. At the last six Garden Shows--1915, 1916, 1917, 1918, 1919, 1920--my Imperial "Ringlets" won 30 First Prizes out of 31 offered. Every bird bred on my farm.

The competition at this show was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

Supreme at Madison Square Garden Is Supreme Everywhere

IMPERIAL "RINGLET" EGGS

You want eggs to produce the Silver Cup and Blue Ribbon winners for next season's shows. No other Barred Rock eggs have ever produced the extreme high quality birds as my Imperial "Ringlets." Hundreds of old customers order eggs every year—these eggs have brought them rich rewards in Silver Cups and First Prizes, and proved the foundation for many a money-making business.

My Imperial "Ringlet" eggs will place you in position to win at next season's shows. You may raise a single chick worth hundreds of dollars—hundreds of my customers have done this. **MY MATINGS ARE UNEQUALED IN AMERICA.** No such magnificent color and barring can be found on any living birds.

My Eggs Are the Best Money Can Buy—They Produce First Prize Birds

Mr. E. B. Thompson.

Randolph, Iowa.

Dear Sir: I just want to say to you that in our 20 years' experience of breeding Barred Rocks we have never found anything that would come anywhere near comparing with E. B. Thompson's "Ringlets." While we have only ordered eggs from you twice, we have got some very fine birds, birds that were splendid breeders, and birds that copped the ribbons in strong competition, too. They have given us the best satisfaction of anything we have ever tried. Respectfully,

GEORGE GOHLINGHORST.

Grand Exhibition and Breeding Birds for Sale of This Richest First Prize Sweepstakes New York Blood. Elegant Catalog Mailed Upon Request.

EGGS From the finest exhibition matings in the world—one setting \$20, two settings \$35, four settings \$60, 100 eggs \$90.

At Last—No More Mites No More Lice

One of the biggest problems that has confronted poultry raisers in the past is how they could keep their fowls free from mites and lice. Countless remedies and methods have been recommended and used, such as sprays, disinfectants, powders, etc., but all of these various things have proven only partially effective. Besides, they require a great deal of time and attention,—annoying both to the poultry raiser and his fowls.

Probably no other thing that the poultry raiser has to contend with means as much in the way of lost profits through reduced egg production, hindered growth, quality of meat, etc., as these blood-licking, profit-reducing pests—mites and lice.

CORONA Mite and Lice Proof PERCH

Will solve this question for you, once and for all. Mites and lice cannot live where Corona perches are used. Mites feed on the fowls while they are on the roost, swarming over their bodies, sucking themselves full of blood, then go back to some secluded crack or crevice to await the next meal. That's where the Corona Perch gets them. The minute lice or mites crawl under a Corona Perch they are "a goner." Corona Perches have a galvanized trough underneath filled with oil. This oil soaks up through the wood so that the underneath part of the roost is always moist with oil,—sure death to mites and lice. The oil is poured into the reservoir through an opening in the top of perch; 30 minutes a year is all the time or labor required to keep roosts filled with oil—just a few minutes two or three times a year—that's all, and the question of lice and mites will not trouble you in the least, because you won't have any. Hundreds of poultry raisers who are using these Perches tell us that it is impossible to find a single mite or louse in their poultry houses. Rev. Morgan Peters says: "I have had Corona Perches installed in my chicken coop after I had given up all hope of ever becoming master of this vermin. These Perches brought immediate relief to my flock and death to the last mite. It truly does the work while chickens are enjoying their night's rest."

Corona Perches come in standard lengths, five feet long. They can be installed in any poultry house. They are very inexpensive, and pay for themselves over and over the first season. They will last a life time, as there is nothing about them to wear out or get out of order.

Write for Free Book and Prices

Fill out and mail coupon today. Tell us how many fowls you have and we will send you our lowest price on Perches needed for your flock. We will also send you a book describing Corona Perches in detail. This book is also filled with much other valuable information for poultry raisers. Don't delay,—whether you have a dozen fowls or a thousand, you cannot afford to be without Corona Perches. They pay for themselves in a few weeks. If they don't completely rid your fowls of mites and lice, you get your money back. We also manufacture Corona Wool Fat Compound for horses and cows, and Corona Balm for household use—products that are well known throughout United States and Canada.

Aristocrat Eggs

**Aristocrat Customers are Winning
Out in Hundreds of Showrooms
Thruout the U. S. and Canada, Win-
ning Out in the Very Biggest and Largest Shows of All**

The sensational records which they have made in the past few years simply stand unsurpassed in the annals of all Barred Rock history. But this winter their winnings with "Aristocrats" are even greater, are even more astonishing than ever before.

THE CLIMAX of their achievements is reached by their wonderful performance at those FOUR GREATEST AND MOST POWERFUL OF ALL BARRED ROCK SHOWS HELD IN AMERICA THIS WINTER—THE MIGHTY NATIONAL BARRED ROCK CLUB SHOW (Nov., 1920)—THE GREAT PREMIER SHOW OF THE SOUTH, DALLAS (Dec., 1920)—THE FAMOUS CHICAGO COLISEUM SHOW (Dec., 1920)—THE MAGNIFICENT NATIONAL POULTRY SHOW (Jan., 1921)—HERE MY CUSTOMERS—with "Aristocrats"—carried home a whole galaxy of First, Second and Third Prizes, Color Specials galore, and many, many other awards. These glorious winnings they made against the foremost and most representative class of Barred Rock breeders in America. During the past few years NO OTHER FOUR SHOWS OF THE ENTIRE WORLD, so far as known, HAVE HAD SUCH POWERFUL COMPETITION from so many strong breeders of Barred Rocks as these four. It is at such WORLD SHOWS as these that the "Aristocrats" are doing their winning.

Aristocrat Eggs Produce Such Winners

For it is to your interest to know that the very same male birds and females (the same identical cockbirds and hens) which produced the greatest of all "Aristocrat" prize-winners last season are again mated up in my yards RIGHT NOW. THEY WILL NATURALLY PRODUCE SUCH QUALITY AGAIN FOR NEXT SEASON. These are tried, proved breeding birds. And my customers positively get eggs from EVERY female in my matings. Not one is reserved exclusively for my own use. (Read this paragraph again.)

THE EGGS from these magnificent matings are only \$15 per 15; \$25 per 30; \$40 per 50; \$75 per 100 and \$300 per 500. DO YOU KNOW THAT BIRDS VALUED AT \$250 AND \$500 EACH WERE PRODUCED LAST SEASON OUT OF THESE VERY SAME MALES AND FEMALES AND THAT MY CUSTOMERS GET EGGS FROM JUST THESE PRODUCING MATINGS? Think it over.

NEW LITERATURE AND GRAND CATALOG — containing overwhelming evidence to prove the above to your own entire satisfaction—FREE.

Remember, it has become well known throughout the entire country that Holterman is the man who is sending out to his customers THE BEST BARRED ROCK EGGS THAT CAN BE PURCHASED ANYWHERE AT ANY PRICE.

W. D. HOLTERMAN, Fancier, Box A, FORT WAYNE, IND.

...This Year... SAVE YOUR BABY CHIX BROODER \$4.96

Cut herewith shows the *Putnam Home-Made Brooder* complete — "A perfectly simple and simply perfect" **LOW-COST Brooder** for saving your Baby Chicks, either those you hatch yourself or those you buy.

See Sample Brooder at Left

Guarantee

I guarantee the Putnam Brooder Heater to give satisfaction or it may be returned to me within 30 days of shipment and the money paid for it will be refunded.

THE materials used to make it were one shoe box; one-sixth yard of oil cloth and one Putnam Brooder Heater. The total cost, including Heater, was \$4.96. A fourteen-year-old boy can build one in an hour with no tools but saw and hammer. This Brooder will accommodate from 25 to 60 chicks and will take better care of them than any brooder made, no matter how elaborate or expensive. Build one NOW and have it ready for the young chicks when they come. Write for plans for making this Brooder and testimonials from satisfied users. I will send you the plans FREE.

Advantages of the Putnam Home-made Brooder

REQUIRES filling BUT **ONCE A WEEK**—no other attention. Patented principle—**EFFICIENCY** guaranteed. Thousands in use. Every **OTHER BROODER** must be filled and trimmed **SEVEN TIMES** a week.

Putnam **HOME-MADE BROODER** is adapted to any size plant from 25 to 60 chicks in one brooder to any greater number desired; simply use more brooders. Is particularly adapted to needs of small breeder and back-lotter who aims to produce one lot of chicks or a few dozen.

No other brooder on the market is **EASIER** or more **SIMPLE** to operate; none uses **SO LITTLE OIL** per chick; brooder consumes less than a gallon of oil **A MONTH**. Send for and read the testimonials.

Putnam **BROODER HEATER** is so constructed that it acts **LIKE AN OPEN FIRE PLACE**, carrying the foul air out and drawing the fresh air in, thus providing **PERFECT VENTILATION AUTOMATICALLY**.

Heat is radiated from **ABOVE** onto the backs of chicks, giving the natural and soothing effect **OF THE HEN**—without the lice.

Hover is so constructed that chicks **FIND EXACT TEMPERATURE THEY LIKE**. Adjustable hover takes care of any season from February to July.

Putnam **HOME-MADE BROODER** CAN BE OPERATED ANYWHERE in a sunny room in a house, an open shed, or, if a roof be built on it, out of doors; can be **CARRIED ANYWHERE** by a half-grown boy.

No other brooder is easier to clean and disinfect. Simply lift out hover and heater—brooder can then be emptied of litter and be disinfected.

Brooder heater is made of brass and galvanized iron—**IS PRACTICALLY INDESTRUCTIBLE**.

Capacity of Putnam **HOME-MADE BROODER** IS **ELASTIC**. When chicks require more exercising space, heater and hover can be placed in larger box or other structure. **THE BROODER GROWS WITH THE BROOD**.

Floor of this brooder is even with the ground and therefore chicks do not have steps or inclines to learn, thus avoiding loss from rain or chilling.

To summarize: At no price, **HIGH OR LOW**, can a brooder be bought so economical in first cost, also in fuel and labor—so simple and **EASY TO OPERATE**, so perfectly ventilated, or one that will so surely raise **HEALTHY AND VIGOROUS BIRDS**.

THE BROODER HEATER
Price only \$4.75, Postpaid.

IN SUCCESSFUL USE FOR YEARS

THIS **BROODER HEATER** is in no sense an experiment. It has been on the market **IN SUCCESSFUL USE** for years. Thousands of them have been sold and they have given uniform satisfaction. Here are sample reports—could furnish hundreds of others like them:

BEST DEVICE FOR RAISING EXTRA EARLY CHICKS.

Sublette, Ill., Dec. 11, 1920.

Dear Sir: Enclosed find check for \$4.75 for which send me one more of your brooder heaters. The one I bought from you last winter was put in use the 19th of January, and I raised 63 out of 65 chicks. The weather conditions were 15 below zero.

I will, for one, say it is the best device for raising extra early chicks.

R. P. REIS,

Specially Breeder of Dark Lined Barred Rocks.

Fulton, N. Y., May 11, 1920.

We received the Brooder Heater in time and we would not part with it. I have 200 little chicks which we have raised in this brooder and they are doing fine—have not lost one yet. Before we had this Putnam home-made brooder we lost many by their getting chilled when small. MRS. C. W. BENNETT.
Route 1.

Jefferson, Ore., May 8, 1919.

Enclosed find check for which please ship me 2 more Putnam Brooder Heaters. Want these to use myself. These heaters of yours used in home-made

brooder boxes have anything else beaten that I have seen yet. E. J. SHUMAKER.

Magnolia, N. J., April 13, 1920.

Enclosed find P. O. money order, for which send me 2 more Putnam Brooder heaters and one dozen wicks for same. Kindly rush order. Through me you have sold several of these Brooder Heaters, and I certainly do enjoy teaching others how to use them. There is nothing else to equal it on the market. I am well pleased with this Brooder Heater and always praise it just as I have done in this letter.

W. B. BARTH.

How to Order:

I do not sell the Putnam Home-made Brooder. I sell the Brooder Heater only. The price of Heater is \$4.75 postpaid. With every Brooder Heater I will send **EASILY FOLLOWED DIRECTIONS** for making the Home-made Brooder. Your dealer should have the Putnam Brooder Heater in stock. Ask your dealer for it, or I will fill your order, all charges prepaid, to your address at the regular price of \$4.75 each. Please send me your dealer's name. Reference by permission. Editor this Journal.

I. PUTNAM Route 305-BELMIRA N.Y.

FREE *and Postpaid* To Every Poultry Raiser

**PURE
DRIED
BUTTERMILK**

WE WANT to send every reader of this paper a free sample of Pure Dried Buttermilk. We want you to see for yourself how pure, fresh buttermilk, right from the churn, is converted into dry powdered form—all the nutritive food values retained, only the water taken out, so that it will keep indefinitely and is in convenient form to add to your poultry ration.

All experienced poultrymen as well as all poultry experts, agree that there is nothing equal to buttermilk for keeping fowls in good condition, reducing cost of egg production and promoting rapid healthy growth of young chicks.

SAVES YOUNG CHICKS.
P.D.B., because of its lactic acid content, is one of the best known preventives of white diarrhea in young chicks. Feed P.D.B. and you need have no worries about losses from digestive or bowel troubles.

Pure Dried Buttermilk

added to the ration you are feeding your laying hens will double your egg production. Tests made have proved that hens that were producing eggs at a feed cost of $23\frac{1}{2}\%$ a dozen on a grain and mash ration, produced more than twice as many when P.D.B. was added to the ration, reducing the feed cost per dozen to $10\frac{1}{2}\%$.

For young chicks P.D.B. is unsurpassed. The lactic acid it contains practically eliminates all digestive troubles. White diarrhea and other bowel troubles have no terrors to the poultryman who feeds P.D.B., because it prevents the harmful bacteria and the disease germs getting a foothold. Consequently the young chicks thrive and grow like weeds. P.D.B. is put up in 10, 25, 50 and 100 pound bags. If you will fill out and mail free

PROMOTES RAPID GROWTH.
As an aid to digestion P.D.B. is unexcelled. Feed it to your growing birds and you will be agreeably surprised with their rapid growth, big frames and quick development.

sample coupon below, we will send you a small free sample of this wonderful product, enough to show you what it is like and to enable you to see how convenient it will be for you to add P.D.B. to any ration that you may now be feeding to your laying hens or growing chicks.

Or, if you prefer fill out the Special 5-lb. Trial Coupon below, send it to us with \$1.00, we will send you a 5-lb. bag postpaid. This 5-lb. bag contains sufficient P.D.B. for 25 laying hens for 30 days. Complete feeding instructions for laying hens and growing chicks will be sent you with this 5-lb. trial package. Just now with the young chick season here, you cannot afford not to send for this \$1.00 acquaintance offer. It will repay you many times over in saving the lives of your young chicks and promoting the health and egg production of your entire flock. We know that after using this 5-lb. package of P.D.B. you will never again be without it, as long as you are engaged in raising poultry.

INCREASES EGG PRODUCTION.
P.D.B. supplies laying hens with Lactic Acid, Vitamines, Proteins, Carbohydrates, etc., in just the proper amount to promote best health conditions and maximum egg production.

S.C.W. LEGHORNS

THE KIND THAT LAY

MAKING RECORDS FOR 1920-1921.

Seattle, Wash., November 10, 1920.

Hollywood Farm:—

Gentlemen—I entered in First Western Washington Egg Laying Contest six pullets hatched May 28th from two settings of your eggs. Five in pen and one alternate. They finished 2nd with these records: No. 1, 279; No. 2, 312; No. 3, 180; No. 4, 293; No. 5, 206; alternate 247 eggs; floor eggs, 19. Had I selected alternate for the pen instead of No. 3 the average would have been 271 1/5 eggs. They did not get credit for a full year's lay because they were hatched late. Number 4 laid 293 eggs from November 19th to October 31st. She would surely have passed the 300-egg mark by November 19th, because she was in full lay at close of contest.

Very truly,

C. H. BURNETT, Jr.

Seattle, Wash., Jan. 9, 1920.

Dear Mr. Atkinson:—

I entered the pen you sold me in Second Western Washington Egg Laying Contest. They are leading the contest with 271 eggs for November and December, 54 1/5 eggs average. Nearly 90 percent egg yield for two high-priced egg months. Some chickens!

Truly yours,
J. W. MERRIMAN.

Ellensburg, Wash., Jan. 9, 1921.

Gentlemen:—

I just received December report for Puyallup Contest. Pen you sold me has laid 258 eggs, an average of 84 1/2 percent since contest started. How do you do it?

Very truly,

E. M. MADDUX.

Auburn, Wash., Nov. 9, 1920.

Dear Sirs:—

Our pen at First Western Washington Egg Laying Contest produced the highest value in eggs. We give all credit to "Hollywood" males. They not only sired our pen, but they sired 500 pullets that averaged over 200 eggs in last 12 months.

Very truly,

SCOTT O. HOLT.

FIVE YEARS WINNINGS IN COMPETITION WITH THE WORLD'S BEST PRODUCERS, UNDER MANY DIFFERENT MANagements AND CLIMATIC CONDITIONS.

TO THE PUBLIC:

300-eggers and better last season.
if not in the world. Address,

We are now offering for sale mated pens, pullets, cockerels and yearling hens with high trapnest records. All this stock is of the same blood lines and closely related to our contest winners. Bred more than twenty Believe we are offering stock and hatching eggs from the best flock of high average egg producers in America,

PURCHASE EXTRAORDINARY

OF VITAL INTEREST TO THE
POULTRY FRATERNITY

WE have just purchased from Owen Farms their entire flock of *Single Comb White Leghorns*. This latest acquisition to our yards includes the famous First Prize White Leghorn Cock at the recent Madison Square Garden Show of which the American Poultry Journal said:

"First cock was one of the greatest cocks ever shown; good head, wonderful back and furnish of saddle; good station and grand sweep from throat around under breast and body; correct carriage, and splendid furnish of tail."

Also Owen Farms First Prize Cockerel at the great Madison Square Garden Show last year. Also First Prize Cockerel at the Madison Square Garden Show, 1919; the First Cockerel at Boston, 1918, and the Cockerel heading the First Young Pen, New York State Fair, 1919. These five males now head five of our choicest breeding yards, which were mated by Leghorn experts.

Aside from the few birds that we will reserve for breeding, we offer at special prices, the balance of this pure Owen Farms Stock in mated pairs, trios, pens and breeding yards; single cocks and cockerels.

For mating list write today to

OAK DALE FARMS, Box A, AUSTIN, MINN.

BYERS' ORPINGTONS

Chicago Coliseum Winnings

At Chicago Coliseum past 28 months—75 of my Orpingtons stood under First Prize Ribbons (all my competitors combined only showed 16 birds under First Prize Ribbons), and in Buffs this winter I showed 11 birds under First Prize Ribbons while all my Buff competitors showed but 3 birds

under First Prize Ribbons; 172 of my Orpingtons stood under Ribbons. I won 13 out of a possible 14 Firsts on Pens and never lost Special for Best Display in Buffs, in Whites or in Blacks at this Premier Exhibition—Chicago Coliseum past 28 months.

I offer brothers and sisters or sons and daughters of above sensational winners in Pens (4 females and male) at \$60 and \$90. Cockerels \$15, \$25 and \$40. (All ordinary and cheaper birds sold). Your satisfaction guaranteed.

EGGS

From CHAMPION EXHIBITION MATINGS.
\$15 per 15; \$28 per 30; \$45 per 50; \$85 per 100.
These Champion Matings include my sensational Chicago Coliseum Winners, and represent \$30,000 breeding value. There is absolutely no substitute for this quality in Eggs to produce the Champions of 1921.

From SPECIAL MATINGS OF CHAMPION BLOOD.
\$5 per 15; \$9 per 30; \$14 per 50; \$25 per 100.

All egg shipments prepaid. Infertile eggs replaced free. Fertility now running splendid.

EDW. F. SCHMIDT Mating List Free **HAZELRIGG, IND.**

Indorsed Everywhere--

AGRICULTURAL colleges, experiment stations and county agents heartily indorse the Buckeye, while men and women of experience unite in the commendation that arises from practical success.

That indorsement is the direct result of more than thirty years of constantly growing service to poultry raisers. Starting with a good incubator -- the leader of its day -- no effort has been spared to maintain that leadership in results.

Nothing has been left to chance. Continuous research has led to actual improvement. Our experiments have been at our own expense, and no effort has been omitted to perfect the Buckeye line, from the 10,368 egg mammoth down to the smallest size--a perfect machine from every standpoint.

Buckeye Colony Brooders have made poultry raising financially successful, revolutionizing the poultry industry. Before their general use it was a common thing for poultry raisers to lose from 25% to 50% of the chicks hatched. Today these same breeders uniformly raise from 85% to 95% of every hatch--and do it without a quarter of the labor and any of the worry.

Ask The Buckeye User -- *HE KNOWS*

Fifteen thousand dealers all over the United States and Canada, and many others in the four quarters of the globe guarantee the Buckeye.

You will find reason for this universal commendation when you learn from experience the reliability, the economy and the convenience of the Buckeye line.

Do not run the risk of placing your order too late. The demand has not been so great in many years, and the only way to insure delivery when wanted is to **ORDER NOW**

Choice Foundation Stock

I am now offering, for immediate delivery, yearling hens, pullets, cocks and cockerels, the offspring of my very best layers, at the same prices that were in force two or three years ago. No better foundation stock to be had anywhere.

My catalog contains descriptions of my plant by representatives of the leading poultry publications, reports of many of my customers, and also my methods of breeding, care and management. It is fully illustrated and very instructive, and will prove to you that my prices are very reasonable.

Start right, by writing for my instructive catalog today. It has helped others, and it will undoubtedly help you.

HATCH EVERY GOOD EGG *with* SOFT HEAT

**Stronger Chicks
Less Expense
Less Trouble
More Money**

Tubeless. Full radiator plate does away with cumbersome, unsatisfactory tubes and pipes.

Smokeless, gasless, odorless. Nothing but pure, moist air reaches egg chamber.

Center Heat. No side lamp. Saves space and weight. Insures equal heating. Radiation from above, as hen supplies it.

Round Egg Chamber
—Just like hen's nest. Makes turning of eggs quick and easy.

Automatic Control
of moisture, heat and ventilation. Requires no attention. Steady, even supply assured, regardless of altitude or weather.

MRS. C. A. ASH, Litchfield, Mich., got 109 chicks from 109 good eggs the first time she ever used a **Porter SOFT-HEAT Incubator**. Roy Klavine, Geneseo, Ill., an inexperienced operator, got 100 perfect chicks from 100 fertile eggs. Mrs. C. A. Saunders, Center, Neb., got 176 strong chicks from 179 eggs, made over \$120 in 4 months, and had 150 chicks left which should make her \$150 more, or a profit of about \$60 a month. Hundreds of Soft-Heat users report 90% to 100% hatches, fewer losses and bigger profits.

Moist Warmth—A Life Saver. Moisture is necessary to life. Both eggs and chicks need it. The Porter supplies it automatically. Simple and certain. You can get big hatches and make easy money with

The Porter SOFT-HEAT Incubator

Duplicates Nature's process exactly. Turns every good egg into a strong, perfect chick. Principle endorsed by U. S. Government. Pronounced the greatest of incubator improvements.

No Suffocation—No Cripples. Eggs don't dry out in Soft-Heat. Moist warmth keeps shells brittle and membranes tender. Chicks break through easily and breathe pure, fresh air instead of poison-laden gases, from the very first. *The Porter hatches no cripples.*

Soft Heat Saves 300% in money, time and labor. 3 to 4 quarts of oil—one filling of tank—completes a hatch. Others burn 4 to 5 gallons and require daily filling of lamp.

Only 2 Minutes' Care Daily. Eggs are turned semi-automatically without removing or lifting tray, reducing necessary care to 2 or 3 minutes a day. A child can operate the Porter.

Make More Money This Year! Take your hatching away from unreliable hens and dead air incubators. Get MORE and BETTER chicks, decrease your losses and increase your profits with the improved Soft-Heat. Use the most scientific incubator ever made. **WE PAY EXPRESS.**

Book Free! Fully illustrated. Explains Soft-Heat in detail. Gives interesting stories of success from many states. Tells how you can succeed and make money from the start with this BETTER hatcher. Send name today—a card will do—for your free copy.

Built for Better Service— and they Give it

DURING the nearly forty years of PRAIRIE STATE history, the steadfast aim has been to produce *the best* in incubators and brooders. The best in design—the best in quality of materials—the best in workmanship. That explains why PRAIRIE STATE equipment is the acknowledged standard—the choice of the experienced expert—the safeguard of the amateur. The leaders in the poultry industry—the men and women who *know*—will say you can't go wrong, you will succeed, if you use

PRAIRIE STATE INCUBATORS AND BROODERS

Hatching and brooding time is right at hand. There's no time to waste on experiments. If you are to make a big success of the season you must use dependable, efficient equipment. PRAIRIE STATE machines will positively give you absolute satisfaction. *That's their record for nearly forty years.*

And this record is backed by the strongest guarantee ever written. The PRAIRIE STATE Incubator is sold to you with a binding guarantee that covers *number and quality* of chicks and *ten years of service* without repairs. The

slight additional cost of the better-designed, better-built, guaranteed PRAIRIE STATE is more than paid in a *single season* by the *extra chicks* hatched, to say nothing of the *better quality* of all chicks produced.

And PRAIRIE STATE Brooders are in the same class as this incomparable incubator. Built in many styles and sizes, there is one that exactly meets your needs. All have one thing in common—they are "first in efficiency."

Settle this question now and settle it right by ordering PRAIRIE STATE equipment. Your poultry supply dealer can probably make immediate delivery. If not, we will. Write us your wants and we will see to it that you are supplied.

Owen Farms Flocks

Stand Pre-eminent

S. C. R. I. Reds

Buff Orpingtons

The entire capacity of Owen Farms is now devoted to the production of these two superb varieties. More and better Reds and Buffs will be produced in 1921 than ever before. My thousands of customers in these two varieties all over this continent and abroad will be glad to know that I have disposed of my white varieties, and that Owen Farms will specialize in S. C. Rhode Island Reds (the best variety ever produced in America), and in S. C. Buff Orpingtons (the best variety ever produced in England).

More than a year ago I decided to make this change, and made my exhibition plans accordingly. Showed Reds and Buffs at the Great New York State Fair, Syracuse. Entered them for one of the largest and most important early winter shows in the West. The day before the entries closed I sold this western string, and they made a great victory for my customer. This plan left me free to concentrate on my exhibit of Whites at the Garden and to dispose of them. This I did and kept my Reds and Buffs quietly at home.

1920—1921 RECORD

At the New York State Fair, Syracuse, where I made my only exhibit of Reds and Buffs the past season, a remarkable winning was made in the largest and best classes shown last fall.

REDS—First and Fourth Cock; First Hen; First and Fifth Cockerel; First, Second and Third Pullet; First Old Pen; First and Second Young Pen; Best Display and all other specials.

BUFFS—First and Second Cock; Second and Fourth Hen; First, Second and Fifth Cockerel; Second Pullet; First Old Pen; First Young Pen; Best Display and other specials.

This great record was made after furnishing a large number of winning birds for other state fairs and large shows.

1921 MATINGS

are far and away the best I ever made. Started selecting hens for these matings last August, banding my best tested producers. In October and November went through the hens once more, and selected choice breeders from my wealth of early pullets. Every female in my 1921 matings handles beautifully, and is a

heavy layer. My cocks and cockerels are far and away the best ever on Owen Farms. Every one is a star, and I have selected just the females to produce the finest possible chicks with each individual male. My 1921 customers will share with me the finest S. C. Reds and Buff Orpingtons produced this year.

1921 MATING LIST

is now ready and is yours for the asking. It carefully describes every mating at \$12, \$18 and \$25 per sitting, and gives a good general description of the fine matings in Group 4 at \$6 per 15. It also describes several fine mat-

ings of trap-nested Reds, and prices eggs from each pen. You want the best your money will buy, and owe it to yourself to read this mating list from cover to cover before you place your order.

BREEDING MALES

Have 100 good husky cockerels that were produced from my finest matings, at \$10, \$15 and \$25 each. A few worth \$35 to \$50. If something has gone wrong with your male or you need one or more additional ones for your matings—write me your exact require-

ments and order directly from this ad. Will select the finest possible bird or birds for you, and know they will do you a world of good. Satisfaction guaranteed every Owen Farm customer, every time.

"Once an Owen Farms Customer, Always a Customer of Owen Farms"

has become a truism. Send your order and learn why my repeat orders constitute a large part of my business.

THE GOLDEN LACED WYANDOTTE

A Beautiful Variety—Long Recognized as Possessing the Utility Qualities of the Wyandotte Breed—Methods of Mating that Have Proven Successful—Defects to Be Studied and Avoided.

By Melvin F. Uphoff

PICTURE a bird of curving lines from head to foot, with neat low comb conforming closely to the shape of the head, stout short beak, reddish bay eye, bright yellow shanks, with plumage of rich golden bay sharply and distinctly laced with lustrous greenish black, and you have the ideal Golden Wyandotte which the best breeders are endeavoring to produce.

To the man who wants recreation, something to rest his mind from business affairs, who wants to breed a variety of poultry that will call forth his best and most skillful efforts to attain perfection, I suggest this beautiful and useful Golden Wyandotte. I do not wish to represent the variety as especially hard to breed, but, like other laced varieties, they are a delightful subject for thought and study. To the man who wants a good layer, a plump broiler, and a choice roaster, they will also fill the bill, with beauty as an added advantage.

The Wyandottes have always held their own as layers with any breed; and the Golden Wyandottes are no exception in this respect. However, egg production is largely a matter of strain, rather than breed, and it is to the credit of the Golden breeders that in developing their respective strains they have never bred for beauty alone, as have the breeders of many of our worthy varieties, which are now nearly extinct.

Improvements in Type.

Breeders of Golden Wyandottes have been most progressive. If we contrast the long tailed, long backed, awkward, leggy, heavily laced Golden of twenty-five years ago with the compact, rounded, graceful, narrow laced bird of today, we see a strong contrast and get some idea of the vast improvement that has been made in the matter of type. In England the breeders have succeeded in producing a wonderfully laced bird, but to do so they have sacrificed type and head points. Without real Wyandotte type and head points, much of the beauty of the laced bird is lost. We must have Wyandotte type to begin with, and while some of our show birds are still lacking in type,

yet we see more and more Golden Wyandottes every year rivaling the Whites in this respect.

To become a successful breeder of any variety of poultry, you must first of all know the Standard requirements of an ideal bird. Study the Standard diligently. Get each section of male and female firmly fixed in your mind. Then attend the poultry shows and compare the birds on exhibition with your ideal. Get the judge or the breeder to point out the defects and compare the birds. Comparison is a great teacher and is the quickest way to learn the good and the bad points.

Look your birds over carefully; study them minutely; compare them with the ideal in your mind; note their faults and consult your Standard again to see just how much these faults are cut in the scale of points. Then select a few of those that conform nearest to the Standard and enter them at one of the larger shows. Winning at a small show often raises false hopes and overconfidence, and teaches you nothing. Better to meet defeat in a large show and learn something, than to win at a small show and believe you have unbeatable stock, only to meet a bitter defeat later.

Mating Golden Wyandottes.

The popular advice is to mate together those males and females that score the highest. While this practice might work out with some of the solid colored breeds where only color and type are required, it will not suffice for the Golden Wyandottes or any other laced variety. I have never examined a Golden that I could pass as perfect in lacing and color. Examine the laced Polish that have been carefully bred for over a hundred years and see if you can find a perfectly laced and colored section.

You must balance the male with the female. If the male is defective in breast lacing, mate him to hens especially strong in this respect. If he has a solid black stripe in hackle and saddle, better not use him at all. Minor defects can be counterbalanced by using a mate especially strong in the section where the other is weak; but birds with solid black hackles and

On the left, a laced feather from the wing bar of the 1st Golden Wyandotte cockerel at the Garden. To the right, a saddle feather from the 1st Garden cock. The open, diamond-shaped center in the saddle of the male is a beautiful feature, and important in producing clean, open, oval centers in the plumage of the female.

saddles, or spangled wing bars, had better be discarded, regardless of how perfect they are in other respects.

"Do you single or double mate?" is the query that I often hear, and my answer is "Both." Birds of good quality of both sexes can be produced from a single mating, but for my exceptional birds, the blue ribbon winners at Madison Square Garden, Boston and Chicago, I double mate. Not to the extent that the Barred Rock breeders do, however, for that is unnecessary.

My pullet matings produce the exceptional females, but at

Golden Wyandotte Cock. A First Prize Winner at Chicago.

the same time the cockerels from these matings are not culled by any means, and the same is true with my cockerel matings. Perhaps in the near future we may be able to produce the highest quality males and females from the same mating, but until that time arrives we will have to continue to double mate to produce the highest quality birds.

No permanent progress has ever been made in any line of breeding without an accurate pedigree of every individual. Guesswork may succeed for a time, but it will fail sooner or later. It takes time to keep an accurate pedigree of each bird, but then everything takes time that is worth while.

Undoubtedly the worst defect both Silver and Golden breeders have to contend with is mossiness or "pepper," that is, the black specks in the golden ground color. It is simply a reversion to the composite plumage of their ancestors. To me this "mossiness" is the most baffling of all defects. I have seen hens with clear, clean centered feathers molt in June (the result of setting) and feather out so "peppered" that they could scarcely be recognized; then go into another molt late in the fall and feather out clean and clear as they were as pullets.

The very narrow laced birds are usually more defective in this respect than those with heavier lacing. The ground color seems to hold its own the first year, but the black intrudes the second year. Weather and body condition of the hen at the time of molting also appear to have considerable influence, as the case of the hens that molted in June and again in October would indicate.

I have seen hens that were clear as pullets molt and feather out mossy for three and four years and molt clean the following year. I believe that the solution of this problem of mossiness lies in the selection of birds for the breeding pens; and I would use males with well defined, narrow-laced wing bars, clean, clear open laced hackle and saddle feathering,

and females that have molted out clean and clear. Smoky top color in males will produce mossy females every time.

The comb is quite often a defective section, especially so in males. Large coarse combs were common a few years ago and are characteristic of the English Golden today; but much improvement has been made along this line. However, defects of comb are much easier to overcome than defects of color and lacing. Head your breeding pens with males as good in this respect as possible, and avoid the use of meat in the daily ration for growing cockerels. A very warm show room during the winter will double the size of a cockerel's comb in a week.

Probably the most faulty colored and laced section of the Golden is the hackle. I have succeeded in producing males that were simply wonderful in saddle, but I have never produced a cockerel of the correct shade of golden bay that I would cut less than one point on hackle lacing alone.

A male with a good hackle and saddle, even though only fair in other sections, will make a very valuable breeder.

The original Standard called for spangled wing bars, but it was soon discarded, for it was contrary to the makeup of the breed and was changed to conform to the other sections. Narrow, even laced wing bars are hard to get, but there have been some shown this year that approach very near to perfection.

Breast lacing has been comparatively easy to breed, and very few of the birds shown now are poor in this section.

Rich Ground Color Desirable.

The trend is toward a much richer ground color, and while some judges still favor the light colored birds, the breeders themselves are striving to produce a richer color. The few judges who still award the ribbons to birds of yellow gold color will have to change their ideas to meet those of the breeders, or quit judging Golden. The breeders, not the judges, are the ones to determine the correct ground color.

The majority of the prominent breeders are in favor of the richer colored bird, and the next edition of the Standard

Golden Wyandotte Hen. Winner at New York and Boston.

will undoubtedly call for a ground color of "rich golden bay" instead of "golden bay." The darker shade is much more beautiful, and while some breeders claim mossiness is more pronounced in birds of the darker shades, I am inclined to believe that the relation between the tone of red ground color and the objectionable black mossiness is more

distant than is generally conceded. Eastern breeders have always bred a Golden of a much lighter shade than those in the west, consequently they are loth to give way to the growing demand for a richer shade. I have always advocated a richer ground color and decided about five years ago to breed for a richer shade.

We generally look to the male for color and to the female for type, but much depends on the vigor and the stamina of either bird; so I secured a very vigorous cockerel of the old Brundage strain that was the darkest shade of Golden I have ever seen. I mated him to a few of my best hens. This was a "single mating" designed to produce average quality in both sexes, with the main purpose of securing a richer shade of golden in both the males and the females. The offspring were, of course, of varying shades, some of very rich red, others running very light in color. I discarded all but the richer colored birds and mated the cock to his pullets and the cockerel that pleased me best back to the hens.

The mating was much more successful than I had expected. Too often such introduction of new blood results in a lot of culls. I have continued to breed this line and have produced some exceptionally rich colored birds in both sexes.

Ira C. Keller, of Ohio, has also been working for a richer shade and has shown several pullets of very beautiful rich color. His pullet at the club show at Boston last year was passed by the judge who regarded her as too dark; but if she were to have been shown this year at Boston she would have been considered of the proper shade and would have been a certain winner.

Open lacing is very desirable, but extremely narrow lacing on back and cushion is too often combined with half-laced feathers on breast, or a breast showing frosting, that is, a marginal edging of red outside the black lace. Frosting is extremely hard to eradicate. Better to have the centers of the breast feathers a little smaller, with distinct black lacing than to have very narrow lacing with a hairline of frosting around the outside edge of the lacing.

The Standard calls for a slate undercolor, but the best laced specimens usually have a touch of red next to the skin. This has a tendency to deepen the surface color and is never found on a bird of very light color. The under color of a light bird is usually white. Under color in the Golden has an important influence on the surface color; the darker the under color, the better the surface.

White in wing flights and main tail feathers often appears as the result of injury, poor condition of birds at molting time, crowding in sleeping quarters, or any other improper treatment. A few years ago some strains developed white in sickle and main tail feathers, especially in cocks; but we do not see much of it today. The majority of beginners are all too ready to lay this defect on the breeder of whom they secured eggs or stock, but nine times out of ten it is the result of their own negligence and ignorance in the care and feeding of their birds.

One of the greatest obstacles to progress in any variety is poor judging. Too many judges are "hobby riders," and unless you know what their particular hobby is and can pick out birds to suit them, you will be among the "also rans." We need more judges who really breed Golden.

THE EGGS, THE STOCK, THE INCUBATOR

Reasonable to Expect 65 to 70 Chicks From 100 White Shelled Eggs—50 to 55 Live Chicks From 100 Brown Shelled Eggs—Strength of Hen At Time of Laying Is a Big Factor In Hatchability of Eggs.

By T. S. Townsley

THE modern poultry keeper has little reverence for the motto, "Don't count your chickens before they are hatched." No matter what value the moralist may place on this injunction, the poultryman has no use for it in his business. The up-to-date poultry keeper needs to know how many chicks he is going to hatch, and in order to plan his work intelligently, he must not only count his chicks before they are hatched, but must count them before the eggs are laid.

If he wants a certain number of pullets to fill his laying houses for next winter, he begins counting early in the spring to determine how many breeding hens will be necessary to produce the eggs required to hatch sufficient chicks to insure raising the number of pullets needed.

This need for counting the chicks before the eggs are even set has led to much careful study of the factors which determine how many chicks can be expected from a given number of eggs.

Fertility and hatchability are the two items which determine the number of chicks produced from each sitting. Of these two items, hatchability is the one which causes most concern to the poultry keeper. The fertility in hatching eggs is nearly always satisfactory when vigorous breeding stock is kept under conditions allowing plenty of exercise and the eggs are handled carefully to protect them against unfavorable temperature conditions. Poor fertility is commonly found among birds that are kept under close confinement or during the early spring months when the low temperatures sometimes kill the germs before the eggs are put in the incubator or under the hen.

Hatchability is a much more important problem than fertility, and a large number of known factors have an influence on the percentage of fertile eggs hatched. To a certain extent, hatchability is an inherited character, as the eggs from some hens invariably show strong hatching power and the pullets from these birds have the same character, while from other individuals the hatches are invariably poor.

Differences in constitutional vigor probably largely explain this difference in the hatchability of eggs from different hens under like conditions, although in some cases hens that are apparently healthy and strong lay eggs that are difficult to hatch.

Several factors in connection with the way breeding stock is handled have an influence on the hatchability of eggs, as has been shown by studies at the various experiment stations. Poultrymen are generally agreed that close confinement of breeding stock has a bad effect on the hatching quality of the egg, and experimental data prove that this notion is well founded. Professor Atwood of the West Virginia Experiment Station reports that in an experiment with hens on free range and under confinement, the free range eggs hatched 83 percent, while only 67 percent of the fertile eggs hatched from the hens under confinement.

The claim is often advanced that the kind of feed fed has a decided influence upon the hatchability of the eggs, but experimental data do not show that this is an important factor, except that when hens are fed rations which stimulate heavy egg production the hatchability appears to be slightly lower than where the hens are fed on a ration which results in the production of only a few eggs.

It seems entirely logical that a hen which is laying comparatively few eggs probably would be able to transmit stronger qualities to these few eggs than would be possible where a hen was laying heavily, or had laid for a long period prior to the hatching season. Dr. Pearl of the Maine Experiment Station showed that eggs from hens which laid heavily during the winter months showed not quite as good hatchability as hens which laid no winter eggs.

Hens vs. Pullets as Breeders.

Poultry breeders generally advocate the use of only mature hens for breeding purposes, and practical experience bears out the fact that chicks hatched from such stock are more likely to be strong and vigorous than when hatched from

pullets. However, with regard to the number of chicks hatched from hens' eggs as compared with eggs from pullets, experimental data do not show that there is any great variation.

It is a well known fact that some hens put much more hatching strength into the germs of their eggs than do others. Just why this is true has not been fully explained, but it is known that hatchability is directly influenced by the physical condition of the hen. A hen that is healthy and in good flesh, with plenty of exercise, lays eggs that are higher in hatching percent than do hens which are in poor health from any condition. Probably, aside from the fact that hatchability is inherited to a certain extent, the most important factor governing hatchability, so far as the hen is concerned, is the health and strength of the hen at the time the egg is laid. It is a known fact that one hen may show fine hatchability one year and the next year under different conditions lay eggs that hatch poorly. These facts indicate the necessity of the poultry keeper giving his breeding stock the very best of care and selecting hens for breeders with the character of constitutional vigor uppermost in mind.

Without question, many of the complaints of poor hatchability result from improper conditions attending incubation. Where eggs are incubated by the natural method, a poorly constructed nest or a location where the hen is frequently disturbed, almost invariably produces a large number of chicks dead in the shell.

In some cases the nests are evidently too dry, especially where they are located off the ground and no provision is made for holding moisture. Hatchability can frequently be improved by placing pieces of sod or other moisture-holding material in the bottom of the nest.

Some hens are naturally better hatchers than others. Occasionally a hen that is sitting does not carefully cover the eggs, so that the temperature is not maintained as it ought to be. Other hens leave their nests for long periods of time, which sometimes results in the eggs being killed if the weather is cold.

The fact that under unfavorable conditions some eggs will hatch while others must be classed as "chicks dead in shell" is due to the eggs from some hens having stronger hatching power than from others.

Temperature in the Incubator.

Where eggs are hatched in the incubator, both temperature and ventilation are known to have an influence on the percent of hatch. In careful temperature experiments conducted at Purdue University, as reported by Professor A. G. Philips, it was found that the best hatches were secured when the incubators were run at a temperature of from 101 degrees at the beginning of the hatch to 103 degrees at the end of the hatch, as measured by a thermometer placed level with the eggs but not touching them.

These tests showed that a temperature of from 103 to 105 degrees is too high and that the number of chicks dead in shell will be increased, as well as the number of crippled chicks, by temperatures running up to 105 degrees at the end of the hatch. The same test indicated that a temperature too low is likely also to increase the percentage of unhatched eggs.

In these tests at Purdue the temperature was very closely regulated and was controlled within one degree of the desired point at all times throughout the hatch. In the incubator giving the best results the thermometer was started at 101 degrees at the beginning of the hatch and was allowed to

increase gradually about one degree each week, until during the third week it ran at 103 degrees.

With many of the cheaper incubators on the market, run as they are under all varieties of conditions from well ventilated basements to cold, poorly ventilated summer kitchens, it is often impossible to hold the temperature within two or three degrees of the desired point, and this great variation unquestionably prevents some of the weaker eggs from hatching. In many cases the lamp goes out some time during the hatch and allows the eggs to become thoroughly cold, or, again, the lamp may smoke up and send the temperature up to 106, 107, or even to 110 degrees, which is bound to kill the germs that were not the strongest, even if no other influence affected the result. Temperature control in the incubator is largely a matter of the reliability of the machine, with due allowance, of course, for the carefulness of the operator.

Moisture Is Necessary to Life.

Probably nearly as important in the influence on the hatch as temperature is the matter of ventilation in the incubator. Here, again, this is a problem principally with the poorly constructed machine. It is a standing joke among poultry keepers that one particular machine on the market will not give good hatches until it is bored full of holes to allow a better circulation of air. Where a large number of chicks stick fast to the shell after the egg is pipped, this is in most cases

a good sign that ventilation in the machine is not correct.

In poorly constructed, hot-air machines the chicks sometimes dry fast to the shell on account of a lack of moisture, while in the inferior hot-water machines the chicks in some cases are apparently drowned in the excess moisture present.

Probably the amount of carbon dioxide present in the egg chamber has an important influence on the hatchability of the eggs, and in some machines the ventilation is so poor that an oversupply of gas develops, to the detriment of the hatch. Moisture in the incubator is largely a matter of proper ventilation, and in the well built machines this feature is taken care of satisfactorily.

Chirping, Bright-eyed Chicks, With Long Bodies and Stocky Legs, Make Glad the Heart of the Poultry Raiser.

The wide-awake poultry keeper overcomes the elements which tend to produce poor hatches by having carefully selected breeding stock under free range conditions, by handling the eggs carefully from the time they are laid until they are set, so that unfavorable conditions will not injure the germ, and by setting them in a machine which is built to hatch and which displays the workmanship and genius of its builder.

Careful attention to the kinds of breeding stock used and the conditions under which the eggs are hatched enables the poultry keeper to estimate with a considerable degree of accuracy the number of chicks to be expected. With white-shell eggs under ordinary conditions the flock owner may reasonably expect at least 90 percent of the eggs set to be fertile, and with proper incubating conditions he may reasonably count on 75 percent of the fertile eggs developing into live chicks.

For some unexplained reason, the brown eggs are almost invariably lower in hatchability than white eggs, and in figuring chicks from brown eggs the poultryman must count on not more than 60 or 65 percent of the brown-shell eggs hatching.

When the well made incubator is set with 100 eggs from selected breeding stock properly handled, it is reasonable to expect that from 65 to 70 live chicks will be developed from white eggs, or 50 to 55 live chicks will result from 100 brown-shell eggs.

S. C. White Leghorns In the Breeding Yard

How to Breed Neat Combs and Standard Tails—Do Not Breed Birds Together Merely Because They Have Been Prize Winners—Mate Each Bird For Definite Improvement.
By W. H. Wagers

IT IS a well known proverb that like begets like, so that if we all had perfect fowls there would be no breeding problem. The mating of two perfect fowls would have a tendency to produce perfect chicks, provided, of course, the breeders were from ancestors of like or similar quality. We do not have perfect specimens from which to breed, so the problem arises as to how to mate two or more imperfect specimens so as to approach perfection in the next generation.

The builder does not attempt to erect a building until he has a distinct idea of what he is to build. He first consults the architect, who provides the plans and specifications, and it is the builder's business to erect the building so as to conform to these plans. After consulting the drawing, the builder, if he knows his business, orders such materials as are necessary to carry out the plan or design of the architect; and he knows, or at least should know, just how to put these materials together to get the desired effect.

The Standard of Perfection takes the place of the architect. In it we find the plans and specifications for a perfect fowl, and as breeders we should aim to produce fowls approaching the Standard model. If we are not familiar with the Standard or have not in our minds a clear conception of what we are trying to produce, our selection of breeder birds is purely a matter of chance, with the chances mostly against us. It therefore follows that the first essential is to get a knowledge of the Standard White Leghorn. We therefore suggest that the breeder study his chosen breed or variety. Get a good breed book and study it. Attend the shows and study the winning birds. Study the photos of the winners at the leading shows until you have in your mind's eye a perfect image of what you are aiming to produce, and then if you know something of the laws of reproduction you are ready to begin.

Mating to Overcome Defects.

Hucksters are plentiful, but real breeders are scarce. We have had the privilege of reading the catalogs of several poultrymen well known to us, and it is amusing to see how they tell about the pains they have taken to build up their particular strain to its present high standard, while as a matter of fact many of them do not even know what is meant by a strain of fowls. They have begged, bought, borrowed and traded until they have secured a number of pretty good show birds, but have never produced anything by scientific breeding. They even speak of their strain, when they have only bred their particular variety for two or three years.

Any breeder can, by careful selection, build up his flock to a high standard by properly selecting a few of his best birds for breeders each season. In doing so, be sure to choose those that have grown rapidly from the time they were hatched and shown unusual vitality. Keep in mind the strong and weak points of your birds and so mate them as to strengthen the weak points. Remember, it takes time, and you must not expect too much in a single season. If your

birds are weak in the saddle, give especial attention to that for one season, and at the same time try to improve some other section. Females with heavy saddles are usually good cockerel breeders. Many times a bird that could not win in the showroom will furnish exactly what you need in your flock. Females whose saddle feathers extend well back over the main tail feathers are valuable as breeders.

Do not make the mistake of thinking that because a certain bird won a blue ribbon it is just what you want for your breeding pen, for that bird may be weak in the same sections as your own flock, and by mating them together you accentuate their defects and weaken your flock. If your females are large and inclined to be coarse, you need a medium sized bird, or perhaps one a little under Standard size with good type, neat head points, and that sprightly appearance so distinctly Leghorn.

The first consideration is to determine just what your flock needs to strengthen it. If you have some small females with high tails, they can be improved by mating with a large bird with a low tail; but if your females are rather large and long, beware of a male bird with a long, flat back, for to breed such a bird will result in too much of the Minorca type. Remember, the Leghorn is made up of curves and should be free from angles and straight lines.

Type and color are, of course, the prime considerations, but the fancy points must not be overlooked. A good head is much to be desired. We have found that a nice five-point comb will sell almost any kind of a cockerel, for the amateur knows that a comb should have five points and the first thing he does is to count the points; but, in reality, the shape and texture of comb should have first thought. Get the five points if you can, but especially beware of large beefy combs of coarse texture.

Value of the Plumage.

One of the things that made D. W. Young's birds so much admired was their soft, velvety coat of feathers. It takes time to acquire this, but improvement can be made by proper feeding and selection. Feed for a luxuriant growth of white feathers and then select some of your best feathered specimens for breeders, and you will improve in this particular and much desired quality. This quality gives to a bird an appearance of superiority, just as the soft, silky coat of the thoroughbred horse marks it as superior to the scrub.

Nothing is more to be desired than a well spread tail. So many of the tails seen in the showroom are hand-made that you should be careful in buying breeders to get birds with a tail spread by nature. Most of our females have sixteen main tail feathers, and this improves the tail very much. Other things being equal, always select the bird with the extra tail feathers. You then have hopes of securing nine on a side instead of eight.

We read much about linebreeding, and some poultrymen

First cockerel, 1st pen cockerel, 2d pullet and 1st hen in S. C. White Leghorns at the Chicago Coliseum show, Dec., 1919.

think they can reach the acme of perfection in their fowls by simply referring to a chart made by some other person. This is a great fallacy. We do not want to be understood as condemning linebreeding, for it is simply scientific inbreeding, but there is no rule for breeding that can be followed as there is in mathematics. In linebreeding as in outbreeding, the exact needs of the family of fowls must be considered at all times. You may adhere to the general principles of linebreeding, but at all times give careful attention to health and vigor and the many nice points that together make up a Standard fowl. We have on two occasions purchased male birds of a different family of fowls, and each time made a distinct advance, for the reason that we had on each occasion a very definite idea of the needs of our flock.

Standard Weight Bird Best for Utility.

In mating your fowls, utility should, of course, be kept in mind, and if you observe carefully the admonitions heretofore given in reference to selecting for breeders only the most healthy and vigorous specimens, you will have no cause to complain about utility. We have never found an egg type as distinct from the exhibition type. We have some extra good layers that are not exhibition birds, yet we have often found that our best exhibition birds were extra good layers, show-

ing that these two qualities may be combined. We must, however, state that the very small, light boned Leghorns, considered by some breeders as exhibition birds, are not good layers. Keep up the size of your Leghorns at least to Standard weight, but preserve the true Leghorn type, style and activity. The Standard weights for Leghorns are: cock, 5½ pounds; hen, 4 pounds; cockerel, 4½ pounds; pullet, 3½ pounds.

We have found that the female most strongly influences the size. Our large, coarse cockerels are, as a rule, easily traced to large females.

In selecting eggs for incubation it is best to discard all undersized and oversized eggs, and the same rule may be applied to breeders. Select chalk-white females of Standard weight, and to these mate the best male birds you can obtain, having regard for the weak and strong points of each. It is a good practice to breed from hens, but you need not hesitate to use pullets if they are fully developed and have been properly raised. Do not breed from weak or immature stock. The fowl must be able to put vigor into the egg, and this applies to both sexes. Many think the number of females with a male determines to some extent the sex, but we have not found it so. Our flock runs about fifty-fifty as to cockerels and pullets, whether we have four or fourteen females in the pen.

TO BREED FINE MOTTLING ON ANCONAS

How the First Prize Pullet at the Recent Chicago Coliseum Show and the Second Prize Pullet at the Last New York Show Were Bred—The Kind of Males and Females to Mate Together.

By Frank C. Stier

FOR the past twelve years my hours at home have been spent with Single Comb Anconas. They have provided relaxation and pleasure, and my success in breeding them is generally known to the poultry world. Ten years before taking up Anconas, I bred Game cocks in large numbers. In all this experience I have never relied much on ironclad rules and regulations on mating, although I have been a very close reader and have studied articles on mating written by everyone whose success as a practical breeder commanded my respect, regardless of what variety was discussed in the article.

The success of the real fancier and breeder, in my opinion, is not made according to some formula. He must develop an eye for a chicken and then study the problem of mating.

I am going to give a few points on selection and mating as practiced by me, although I feel that it may be difficult for you to grasp what is meant, for even to my closest friends I find it hard to explain the whyfore of certain decisions in the mating of my Anconas.

I presume that it is the same in feeding. One man will study formulas for fattening, and another man will study his stock and the way it responds to his methods of feeding. In the case of the latter, the old adage is true, that "the eye of the master fattens his cattle." It would be difficult for him to put his successful practice into words. With this explanation, I will get down to brass tacks and try to give the breeders of Anconas the benefit of my experience.

Selecting the Foundation Bird.

In selecting a bird for the breeding yard, a man must have enough vision to see ahead a few years. He must be able to absolutely fix in his mind a certain definite type and color, and then work with tenacity and ability toward that goal. I would not pick out a bird for breeding merely because it won a prize. I select a breeding bird because it is a specimen that has specific qualities that I need to help me reach my destination.

To my mind, a most serious weakness with new breeders is the breeding back to so-called foundation specimens in the line, regardless of the worth and merit of those birds as builders for the future. It is a part of my creed to only breed a chicken because it will help me to get somewhere.

This basis for selection of breeding birds is not in accordance with the high-power breeding charts—none of which a

Philadelphia lawyer would be able to fathom, let alone follow.

Starting with a high-class male or female this season, and mating its offspring back to it, in a blind, pedigree-chart method, and following such a system for four or five years, will give you at the end of that time birds that show no improvement, and you are just where you started and have accomplished nothing. In varieties that are perfected, such as Black Breasted Red Game Bantams, linebreeding by chart is a different matter, for you are striving to maintain and reproduce their quality; but in Anconas much improvement has been made in the past, much remains to be made in the future, and we must make our matings so our stock will forge ahead.

I follow one path and one theory only, to-wit: selection of the best specimens that I have, as measured by the ideal I am striving to produce. My present best specimens are not that ideal, and they in turn must go and have their places taken by each new generation.

Of course, my birds are inbred, and I not only follow their pedigrees closely, but study each crop of chicks to keep in close touch with the breeding tendencies of my birds.

In my matings, my dominant thought is type, color, head points, and leg color, in the order named. Give me the type and the balance is not so hard.

Double or Single Mating.

Is it possible to produce exhibition males and females from single matings? In justice to all, I say it is. However, it has been my experience that it is difficult to produce exhibition cockerels and pullets from a single pair. They usually run strong either way. I have in mind one of our best cock birds. For three seasons he has produced wonderful pullets, in fact some experts say that they are the finest females in type and feather yet shown. Now, the good cockerels from this cock have been few and far between.

In the same way, we have a cock bird that the past season produced at least twenty cockerels that won a first or second prize at fifteen leading shows throughout the country, and he also sired the first Coliseum pullet and second Madison Square Garden pullet; but his percentage of exhibition pullets was not large. This shows that Anconas can be produced by single mating.

Every breeder has an ideal mating. I have mine and here it is; take it for what it's worth: (Continued on page 348)

HATCHING AND STARTING OF CHICKS

Setting the Hen—Brood Coop for Hen and Chicks—Feeding the Chicks—Incubator Chicks Require Exercise and Green Feed—Do Not Crowd the Growing Chicks in Colony Houses.

By Chas. A. Simmonds.

FROM the fanciers' viewpoint early chicks may not average quite as high in quality as those hatched later when there is abundance of invigorating sunshine and the range provides vegetable and insect life, but the culls from the early broods bring a more profitable price as broilers, the pullets are ready to lay when eggs are highest in price, and those that moult in fall or early winter make breeders equal to hens in the spring. Thus the early chicks are quite profitable from a utility standpoint and the fancier who desires to supply his customers with well developed young stock for the early fall fairs they are a necessity.

The amateur is frequently of the opinion that it is very difficult to give broody hens the necessary protection from the cold early in the season to enable them to bring off good hatches. Such is not the case. All that is necessary is to protect the setting hens from wind and rain, to use nesting material that will pack close, and thus conserve the heat, and to keep plenty of whole corn and water before the hen so she will not be forced to remain off her nest too long searching for food.

Nest for Setting Hens.

A nest box for a setting hen should be about the following dimensions: 14 inches square, 15 inches high, with a board in front at the bottom, 5 inches high. The upper part of the front should be a door which can be used to confine the hen to the nest the first few days after transferring her to the nest. It is also necessary to use this board or door again when the chicks are due to hatch, so that they will not fall out of the nest and become chilled.

For nesting material use sawdust, fine chaff or hay seed for the bottom of the nest; and cover with a little soft prairie or wild hay, something that will pack well to exclude the air, yet be long enough to hold its shape. I have sometimes soaked the chaff or sawdust with water before putting on the hay. This causes it to pack and ensures plenty of moisture for the eggs.

Almost every poultryman has a different method for managing his setting hens. Some use a separate runway for each hen. These should be large enough to enable her to run and fly, for if deprived of exercise a broody hen is very likely to have diarrhoea. I have always had excellent results without the extra trouble and expense of providing a separate runway for each individual hen. The fact is that as many as twenty hens may be set in a house 10x12 if rightly managed.

Always transfer the setting hen to her new nest by daylight, and not night, as advised by some. But do not trouble her too soon. Let her set for a few days where she first became broody. If you attempt to move her too soon you may break her up from the desire to set, and she will start laying again. After she has set close for several days wrap her in a burlap bag so she cannot see and so she will not feel the cold wind while being taken from the laying to the setting house.

Upon arriving at the setting house give her her freedom until she has eaten all the corn and drank all the water she cares for. During this time she will look over her new surroundings, and see that the house she is in does not differ greatly from the one she came from, and that there is nothing strange to make her afraid.

After she is through eating gently push her on the nest you wish her to occupy and close the door. Returning several hours later open the door of her nest, and if she starts to come off close it quickly. If she does not come off as soon as the door is opened watch her closely so as to put her back on the nest should she come off later.

In two or three days you should be able to leave the door open all the time, the hen coming off at her own

free will once a day (oftener in hot weather) to eat, drink and exercise, returning to the nest at the proper time.

The hen is now ready to have the eggs placed under her, and should be given no more than fifteen eggs, and thirteen is safer early in the season. After setting the hen let her alone until her eggs are due to hatch, then close the door to her nest. If you leave the nest open while she is hatching the chirps of the little chicks will attract the other hens, and in endeavoring to all crowd on the one nest, eggs will be broken and chicks mashed.

At hatching time, when the hen is shut on the nest, the door should be opened and corn and water held within her reach. This will help to keep her quiet and contented longer, and the longer you can keep her quiet the better, for if forced to remove her and her chicks from the nest too soon some of the chicks may be too weak to run to their mother for warmth. If they get lost from her in the coop they will chill before being found by the attendant.

When the hen can be kept quiet and contented I prefer not to take her off until her chicks are about 48 hours old. The hen and chicks should now be placed in a good brood coop.

First Home of Hen and Chicks.

An excellent brood coop for a hen with a brood of chickens, and a coop that may also be used as a roosting house for part of the brood later in the summer, and for a single male bird in the fall, is 10 feet long, 3 feet wide and 30 inches high. For the sides and ends use a 12-inch board at the bottom and a 6-inch board at the top. The rest of the coop should be of wire netting, except three feet from the north end, which should be a shed, tight on three sides, floor and roof, with a slat door on the south side, which will confine the hen to the shed, but let the little chicks run.

For the first few weeks the chicks should be confined to the coop, which is moved to fresh ground frequently.

The 12-inch board at the bottom of the wire pen portion of the coop keeps the cold wind off the chicks while they exercise in the sunshine. When they are five or six weeks old a stone may be put under each corner of the coop, which lifts up the coop enough to give the chicks free range, yet confines the mother hen so that she cannot range too far with them, especially early in the day, when the dew is on the grass. The chicks should receive their first feed when about 60 hours old. This may be a soft feed, something that will not tax any digestive organs. I have used with success the following mash: Eight parts flaked hominy, 4 parts rolled oats, 1 part each of bran and middlings. This is mixed with boiling sweet milk and fed three times a day for the first four weeks. A good commercial chick-growing mash may also be fed with success.

Be careful not to overfeed. The heaviest feed should be given at night so the chicks can go to sleep with full crops to last them through the night.

After the chicks are given free range they should have cracked corn or a mixture of cracked corn and wheat, which can be fed by hand or from an automatic feeder.

As they learn to operate these feeders they are fed less mash, and the hominy and middlings are omitted and the rolled oats increased. For chicks three months old and older I use a large quantity of sprouted oats as a soft feed. These oats are sprouted in the earth and are fed when the sprouts are not over one-quarter inch long.

Incubator Chicks.

For chicks that are hatched in incubators and reared in brooders, special attention should be given to exercise and green food. Both absolutely essential for good growth and development. (Continued on page 347)

"WE LEAD, OTHERS FOLLOW"

EDITORIAL

American Poultry Journal

Entered as Second-Class Matter August 9, 1886, at the Postoffice at Chicago, Ill., under Act of March 3, 1879

SUBSCRIPTION PRICES

United States,	1 Year	3 Years	5 Years
Cuba, Mexico & 12 issues	36 issues	60 issues	
U. S. possessions	\$0.75	\$2.00	\$3.00
Canada	1.00	2.75	4.25
Foreign	1.25	3.50	5.50

Canadian and foreign subscriptions require additional postage, therefore the slight difference in prices.

TRIAL SUBSCRIPTIONS — In order to acquaint prospective subscribers with American Poultry Journal, we will mail one copy a month for four consecutive months to any point in the United States, its possessions, or to Cuba or Mexico, for 25c. The trial subscription offer (4 months for 25c) is for new subscribers only and not subject to renewal for a period of less than one or three years.

AUTHORIZED AGENTS — Our agents are acquainted with receipt blanks bearing the imprint of American Poultry Journal and good only for a 4-month "trial offer." No agents are authorized to accept one or three-year subscriptions or subscriptions for any other publication. All one or three-year subscriptions should be mailed direct to our office at 523 Plymouth Court, Chicago, Ill.

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

The Market for Poultry Meat

Under date of February 3, U. L. Meloney, president of a commission house in New York City, wrote that heavy-weight, high-grade capons, in ton lots, were selling at \$6.50 to \$9 each. That is as much as a farmer in Illinois could get for 100 pounds of hog.

Ordinary poultry meat has been selling at good prices. During January a farmer in Oklahoma could get 26 cents a pound, or \$1.30 for a 5-pound hen. At the same time, many sheep owners in Wyoming and Utah were willing to sell a 125-pound ewe for \$2.

On February 1, an Illinois farmer's wife could get, on the Chicago market, \$32 for 100 pounds of live poultry. On the same day, if her husband had loaded his wagon with corn from his crib, and hauled it to town, it would have brought him about \$16, or half of what twenty 5-pound hens in a crate were worth on the Chicago market.

If, on the same day, he had sold fat steers, he would have received \$9 a hundred pounds for them. That is 9 cents a pound against 32 cents a pound for chickens.

There is a difference between hens and steers. The only by-product of a chicken is its feathers, which do not weigh much.

In a beef, there is not only round steak, but hide, tallow, fertilizer and glue. All of these by-products must be sold. When hides are worth only 14 cents a pound and the leather market is glutted; when farmers cannot afford to buy fertilizer because grain is so low in price that it does not pay to fertilize the fields, no packer can pay a big price for steers. It is poor business for him to tie up a lot of money in hides and bones. The by-products have got to be sold as well as the beef itself.

Is it any wonder that on the last day of January, Armour & Co. were not killing beef? Their force of workmen were home and they were out of the market for the day.

The packers have had a bad year on meat. They have had a good year on poultry and eggs. Pretty much the same is true of the farmer. Poultry and eggs are the two com-

modities on which he has continued to make money after other farm products hit the toboggan. While, in general, farmers have laid off buying things, it is probable that they will spend more money for incubators, brooders, poultry equipment, and better stock than on any other branch of their farm husbandry.

It is said of business in general that when the farmer quits buying, things stagnate. The five million owners of farm flocks in this country are deriving a handsome return from their poultry, and are now more interested than ever before in the things that make poultry pay: suitable hen houses, the necessary equipment for early hatching, and purebred stock.

Combine the Practical with the Attractive

Beauty alone is not bread and meat. Much as the world needs beauty, we cannot live by it alone. The pleasing superstructure of beauty must rest on a foundation of utility.

It is well to occasionally stop and consider the masonry in the foundation, and see if the specifications can be improved and the groundwork made more solid.

In this issue of the Journal, Frank H. Davey, known for twenty years as one of the greatest breeders in America, calls for a recognition of the newly established utility points in the practical work of judging in the showrooms.

Other prominent fanciers, whose articles appear in this issue, emphasize that utility is, and must remain, a fundamental consideration in the work of mating and breeding.

Melvin F. Uphoff, a young man who has come to the front rapidly in an old established variety, comments on the practical side of breeding Golden Wyandottes, saying that the breeders of this fowl have never bred for beauty alone.

Frank C. Stier, in his article on Anconas, emphasizes feather and color, but says that these must not be obtained at the expense of substance and body. He refers to the nightmare of losing substance.

Frank F. Conway remarks that the Buff Orpington has

advanced because its breeders have adopted a type that is compatible with usefulness and productiveness.

W. H. Wagers admonishes beginners in White Leghorns to hold Standard size, warning them that small, light boned birds, considered by some as exhibition birds, are not heavy layers.

O. L. Putnam, after outlining in detail the mating of Light Brahmas, adds: "Perhaps I have not laid enough stress on the fact that constitutional vigor is the one prime factor in all lines of breeding."

Standardbred poultry is not merely "fuss and feathers." The man who trusts that asinine sophism and breeds a small, weak bird simply because it has "color," will find that he not only loses prizes but loses profits when he consigns his rubbish to the butcher's mart.

The purebred breeder who is worthy of consideration insists on having a chicken first: one that has a strong skull, face and beak; bright eyes; strength and proportions of body; and straight, well modeled legs and toes. He also wants furnish of feather; and no long headed, shallow bodied, weak legged specimen ever grew finish of plumage. Added to this, he wants color, which lifts his birds above the commonplace and makes them akin to the feathered creatures of the woods whose beautiful plumage appeals to all alike.

Usefulness and practicability should go hand in hand with beauty. They should not be divorced and beauty sacrificed. There is a special market value in attractiveness when in combination with utility.

Two real estate operators developed two adjoining pieces of property in a suburb of a large city. They built an equal number of houses, and they each invested the same amount of money. One of them hired an architect who put beauty into his designs. The other builder was of a so-called practical turn of mind. He did not understand the nature of man, which calls for a beautiful home, not merely a tenable, practical house.

When it came to sales, the real estate man who built houses that would contribute their part to the making of home life more beautiful realized 30 percent more than the man who was actuated only by a desire to build practical houses.

The home-seeker takes for granted that every house has a foundation and a heating system, and as he walks up the avenue he looks at the varying architecture of the different houses. He selects for his own home the one that appeals to his sense of taste and comfort.

The beginner in poultry culture likewise assumes that all hens lay and all hens yield up their carcasses for food. He therefore wants a hen that is something more than a non-descript. The job of the breeder is to design and produce this beautiful fowl, which also combines in her organism the capacity for great practical usefulness.

To Specialize in S. C. Reds and Buff Orpingtons

One of the best, squarest, and most highly respected poultrymen in the United States is the proprietor of Owen Farms, Maurice F. Delano. His poultry plant is one of the largest, his flocks among the biggest and best in their respective varieties, and his business one of the most successful in the country.

It naturally follows, therefore, that the recent transfer of Owen Farms' entire flock of 700 White Plymouth Rocks to Wilburtha Poultry Farms, and the sale late in January of Owen Farms' entire White Leghorn flock to Oak Dale Farms, should be recorded as the biggest and most important deals in purebred poultry since Oak Dale Farms purchased outright the famous D. W. Young flock of S. C. White Leghorns.

"What does Delano mean? What are his plans for the future?"

Mr. Delano does not answer these questions until he has first spoken of his customers who have so long trusted Owen Farms and who are breeding the Owen Farms strains of White Plymouth Rocks and Single Comb White Leghorns. He says:

The past few weeks have seen the disposal of both flocks, and they have gone into capable hands where the blood lines can be held intact and my customers in these two fine varieties have their wants filled

from pure Owen Farms birds. I could probably have netted more money to have dispersed the flocks and sold them off in small lots. I preferred, however, to sell the flocks intact and protect my many customers. Have been greatly gratified by the letters that have come from customers in White varieties that express regret at the step I have taken, but wish me all success for the future with my Reds and Buffs.

Having given his first thought to his customers who are his friends, he tells in the following words the inside story of why he decided to reduce his own breeding operations to two varieties:

In the spring of 1917 I sold my White Orpingtons and White Wyandottes, and thus reduced from six varieties to four. This step was partly forced by war conditions which had affected my business. It proved to be the most fortunate thing I was ever forced to do. Immediately my trade in four varieties became larger than it had been previously in six. By no stretch of the imagination could this all be ascribed to the comeback after the war, and it set me thinking and figuring.

When I first went into Leghorns I was renting the far farm, and placed the Leghorns on it away from my heavier breeds. As time went on, we found it impossible to have the proper man there to properly handle the Leghorns. Therefore I gave up my lease on the far farm, which was six miles out, and moved the Leghorns to Tashmoo and concentrated. Have been in trouble ever since. Leghorns are a fine breed, but have no business on any farm where there are heavy varieties. It is impossible to keep the early cockerels from going through the woods one-quarter mile or more and joining the flocks of pullets.

Four varieties on Tashmoo Farm crowded me. I have been unable to do many things that I will now be able to do, and which will be of permanent value to the poultry industry as a whole and to the Owen Farms flocks and customers.

The future of Owen Farms? I am looking forward with the keenest pleasure to carrying out many plans that it has been impossible in the past to carry out because of lack of room. I now have ample housing facilities to develop my fine flocks of Reds and Buffs along modern breeding lines. My birds have been carefully bred for size, bone, vitality and egg capacity. When they have been trapped by customers they have made good. Am now going to develop both flocks by trapping here.

Am going to keep more complete records than ever before and prove conclusively by these records many facts my long experience has proved to my own personal satisfaction. These things will not only prove beneficial to Owen Farms flocks, but will be of infinite value to Owen Farms customers and to the poultry industry as a whole.

Every bird on the farms, and every part of the work being done here, will now be under my personal direction. I will raise some more birds in Reds and Buffs than in former years, but it is not my intention to raise as many as I formerly did in four varieties. More room and more equipment will be devoted to each individual bird, and with the ample facilities now at my command I will be able to produce quality and results as never before.

This is the age of the specialist in every walk of life, and Owen Farms is now in this class. I do not expect to come down to one variety, as I believe my long experience will enable me to properly handle two. I will not hesitate to come down to one, however, should the future demonstrate the wisdom of this step. No one brain, or one set of brains, is capable of doing as good work with three or more varieties as can be done with two, or even one. Twenty-three years devoted to breeding and raising four or more varieties has proved to my satisfaction that the last statement is an unquestionable fact.

I am now looking forward with absolute confidence to the future development of Owen Farms and the Owen Farms flocks, and will derive much greater pleasure and personal satisfaction from my work, now that I am concentrating all my thought and time to two varieties, than when I was spread out thinner in the development of four, or even six.

Owen Farms is one of the best equipped purebred poultry establishments in America. The main breeding farm is ideally located on the shore of Tashmoo Lake and derives its name from its location. This farm contains 160 large, commodious breeding pens, with long, roomy yards that the mild climate enables the birds to enjoy nearly every day of the year. The yards have abundant shade, and the soil is ideal for poultry, as it is porous and gently slanting, so that there is never mud, and water quickly drains off. On this farm there is a roomy cockerel house with 76 pens, each 3 feet square, with outdoor runs. There are 75 colony houses, each 8x8 feet, and the remainder of the 50 acres are devoted to free range growing quarters for young birds. Every inch is available for use and is utilized.

Tashmoo Annex, a splendid 60-acre farm, only touches the main farm at one corner, overlapping just sufficiently to get a road through. On this farm are eight long brooder houses each 90 feet long, that were originally designed as part of a capon plant, but are now used in the following manner: One is used as an oat-sprouting house, another as a washroom and fitting room for white birds; a third as a fitting room for colored birds during the show season, and then for chicks in the spring; a fourth for sitting hens; while

the other four are used for early chicks. A model incubator cellar and a splendid place for keeping our eggs for hatching are part of the equipment of this farm.

Probably no big farm in the country hatches more chicks with hens than are hatched at Owen Farms. We know from many personal visits that few

growers pour more feed into their birds or go to equal expense to develop their young stock. About twenty acres of scrub oak are cut up into yards, each containing about one-third acre, and these large parks are used for individual males of outstanding quality. Mr. Delano has had the necessary equipment

and ability to carry on four and even six varieties with a measure of success that rivaled the best work of specialist breeders; and now that he has concentrated on Single Comb Rhode Island Reds and Buff Orpingtons, his progress and success should be even more rapid and remarkable. Needless to say, he has large flocks in Reds and Buffs.

Baby Chicks Hatching Eggs

Here Is Your Opportunity

to get Baby Chicks and hatching eggs from which you will receive the greatest returns for your money that is possible for anybody to obtain.

You are well aware of the fact that your success with poultry depends entirely upon your foundation stock, and if you want stock that is absolutely dependable you should get the strain that has stood the test—which is

Shands White Hill Farm Strain S.C. White Leghorns

They won at Heart of America Show, November, 1920, 1st, 2d and 4th Cockerels; 2d Cock; 2d and 3d Hens; 1st and 2d Pullets; 1st old pen; 1st young pen; A. P. A. Medal for the Best Cockerel in the Mediterranean Class, Best Display and other Specials—*then another thrill*—At Kansas State Show, Topeka Kan., January 10th to 15th, 1921, 1st Cock; 1st and 2d Cockerels; 1st and 7th Hen; 1st and 2d Pullet; 1st and 4th Pen; Best Display; A. P. A. Medal for Best Cockerel in the Mediterranean Class. Won A. P. A. Gold Medal for Grand Champion Sweepstake. Cockerel of Kansas State Show.

We can also supply you with baby chicks and eggs from Purebred Bred-to-Lay

FIRST PRIZE COCKEREL

Barred and White Plymouth Rocks

When ordering either eggs or Baby Chicks from us you have the assurance of knowing you are getting them from our own matings and the same high quality that we raise our own stock from. We buy no outside eggs for hatching Baby Chicks. Breeding stock is at all times open to the public for inspection. We use only good *pure-bred, healthy, vigorous breeders*, thus assuring you chicks that *live and grow*.

Our Records positively show our stock is all bred for dependable results. Mating list free on request.

FIRST PRIZE PULLET

"Quality Chicks," But No Available Quantity.

In the July, 1920, issue of American Poultry Journal, there appeared the following announcement:

H. H. Mason, advertising under the name of Quality Chick Company, Des Moines, Ia., carried a small advertisement in American Poultry Journal for three months this past season. He evidently received a great many orders which he did not fill. We have received numerous complaints from our readers and are taking up the matter with the U. S. Postal authorities.

Mason has left Des Moines and located in Kansas City, but has not announced his new address where mail will reach him. All complaints from A. P. J. readers will be adjusted as rapidly as possible.

Since the above item appeared in the Journal, Mason has been apprehended by Federal Post Office authorities. It appears that the chick business was not his first venture into the mail order "game."

Some years ago under the assumed name of J. T. Towney of Adel, Iowa, Mason was arrested by the Federal authorities for fraudulent use of the mails in connection with the Majestic Squab Co.

He was released on bond, and removed to Malvern, Ark., where he assumed the name of H. Macey, and proceeded to do a mail order business in kaffir corn, at absurdly low prices. He was again indicted for fraudulent use of mails and served a term of one and one-half years in the Federal penitentiary at Atlanta, Ga.

Upon being released, he was re-arrested at the gates of the penitentiary for his squab deals, taken to Adel, Iowa, and fined \$300 and costs.

He then moved to Des Moines, Iowa, and started advertising under the name of the Quality Chick Co., offering chicks at 10 cents each, which was considerably below the prevailing market price. It appears that the Quality Chick Co. took in about \$14,000 for chicks last season, but shipments of chicks were not made. Mason was then arrested by Federal agents for fraudulent use of mails and released on a \$5,000 bond.

Mason removed to Kansas City last summer, and under the name of the National Chick Co., started in to advertise chicks at 12 cents each, postage or express prepaid. It is said that he obtained his working capital from a \$2,000 life insurance policy that had been paid to his wife.

We are informed that a postal inspector is watching Mason closely at this time. He checks each piece of mail delivered to the National Chick Co., and we understand that Mason makes regular statements which check with his deposits in the bank. As yet there appears to be no evidence of fraud in connection with the National Chick Co.

Mason claims that his idea in offering chicks at such low prices is to establish a name and trade for National Chick Co.'s baby chicks. That was his explanation when we wrote him a year

THE LAYERS WIN AND THE WINNERS LAY

Regal Dorcas

EGGS BRING SUCCESS

Regal X First Pen Cock, Boston, 1918

Regals Win Three National State Meets

Toledo, Ohio, Jan. 1921.

John S. Martin, Esq., Port Dover, Ont., Can.

Dear Sir:—In looking over the Poultry papers for last month, we were pleased to note the wonderful record you made at the National Meet of the White Wyandotte Club, held at Kansas City. Please allow us to congratulate you on your wonderful win.

We realize that you are always interested in what the Regal Strain is doing in the hands of your customers and wish to report our success for this year.

At three State Meets of the National White Wyandotte Club we won eleven out of seventeen first prizes, three best displays, and seventeen special prizes, fifty-one birds placed out of fifty-seven shown.

At the Michigan Meet held in Detroit, Dec. 7 to 11, 1920, we won first and fourth pullets, third and fifth cocks, first hen, first old pen (no young pen shown), best display, four Club and two Show specials.

At the Ohio Meet held at Toledo, Dec. 28, 1920 to Jan. 2, 1921, we won first, second and third cockerels, first and third pullets, fifth cock, first hen, first and third young pen, first and third old pen, best display five Club and three Show specials.

At the West Virginia Meet held at Huntington, W. Va., (our birds were on the road three days), we won first and fifth cockerels, second and third pullets, second cock, first hen, third pen, best display and three special prizes.

To say that we are satisfied with the Regal Strain is a mild statement, for we are more than satisfied. As for their laying ability, "It's simply great." We are enclosing a photo of the first prize pullet at Toledo, 1919, in a class of 29 pullets. She has a record of 23 eggs in 29 days.

Hoping our report will prove as pleasing to you as it has to us, we remain,

Respectfully yours,
WHITNEY and WERDEHOF.

FIRST and FOURTH COCKERELS AT CINCINNATI.

Harrison, Jan. 1921.

John S. Martin, Esq., Port Dover, Ont., Can.

Dear Sir:—From the eggs purchased last Spring I raised five cockerels and two pullets. At the recent Cincinnati Show, Jan. 1921, I won first and fourth cockerels. Your birds are silvery white and it is this color and the type that is several years ahead of the Standard that Judges like and therefore the Regal birds are invincible. Being my first attempt on fitting birds I spoiled my best bird in washing or possibly I might have scored three places in the five.

Fraternally yours,
W. W. BRACKENRIDGE.

62 EGGS IN 62 DAYS.

Robinson, Ill., Jan. 1921.

John S. Martin, Esq.

Port Dover, Ont., Can.

Dear Sir:—I have 25 pullets raised from a pen out of your Dorcas eggs that are now giving me a 70% egg yield. Most of these pullets are from a hen which laid 114 eggs in 126 days and has a record of 62 eggs in 62 consecutive days. This hen did not quit laying until the latter part of November she was never broody and is fit to go in the show room. Will want another setting of eggs from you this Spring.

Yours truly,
O. R. HEDDEN,
Asst. Principal High School.

FIRST and THIRD COCKERELS AT HAGERSTOWN.

Johnstown, Pa., Nov., 1920.

John S. Martin, Esq.

Port Dover, Ont., Can.

Dear Sir:—I showed two cockerels at Hagerstown last month and won 1st and 3rd. They were out of stock from eggs purchased of you and you will notice I advertise the Regal Dorcas strain. I give you most of the credit for my Hagerstown win and I surely am pleased.

Yours for Regals,
JAS. RINGLER.

REGAL DORCAS WHITE WYANDOTTES ARE THE IDEAL FOWL.

REGAL MATINGS FOR 1921

For years I have made it a practice to reserve my prize winners. With but few exceptions, my winners at Madison Square Garden, Boston, Syracuse and Kansas City are all in my breeding pens at Port Dover, as well as hundreds of others of the same breeding, and very close up to them in quality.

WHAT DOES THIS MEAN TO MY CUSTOMERS? It means that my customers who send to me for eggs will get them from the very best lot of matings in America. No pens reserved. I have always sent out eggs from my best birds, and this fact being generally known, has done more to build up my business than anything else. What other breeder has sent out eggs that have produced First Prize winners at Madison Square Garden, Boston and Chicago?

For the season of 1921 my sixty-eight Exhibition and Dorcas matings are the finest I have ever offered, and represent the result of years of careful breeding.

FREE.—Send for 20 page catalog, fully illustrated, telling all about the Regal Dorcas Strain and my matings for 1921.

Send Ten Cents for a copy of my Regal White Wyandotte Book. The information it contains will be very useful to you.

Eggs for Hatching

Dorcas Matings:—

\$ 5.00 per 15 eggs.
15.00 per 30 eggs.
27.00 per 100 eggs.

Special Matings:—

(Exhibition or Dorcas)
\$10.00 per 15 eggs.
18.00 per 30 eggs.
25.00 per 45 eggs.
50.00 per 100 eggs.

Special Utility Matings:—

\$20.00 per 100 eggs.

All-Star Matings:—

\$20.00 and \$25.00 per 15 eggs.

1000 Cockerels, Hens and Pullets for Immediate Sale

Special value— Male and four females, \$40.00, \$50.00, \$75.00 and \$100.00.

Choice pedigreed cockerels — \$10.00, \$15.00, \$20.00, \$25.00 and \$35.00 each.

Hens and pullets — \$7.50, \$10.00, \$15.00 and \$25.00.

JOHN S. MARTIN

P. O. Box 51

PORT DOVER, ONT.

ago, questioning his advertising before it appeared in the columns of A. P. J., under the name of the Quality Chick Co., offering chicks at 10 cents each.

The National Chick Co. is now located in Room 612 of the New York Life Building, Kansas City, Mo.

This case of the Quality Chick Co. again illustrates the fallacy of hunting bargains in the way of poultry, young or old. There are certain fixed charges in the production of live stock that can neither be side stepped nor beaten around the bush.

What Dupes We Mortals Are.

A subscriber writes:

Do you know anything about sex testers that will tell the sex of a baby chick, or whether an egg will hatch a cockerel or a pullet?

There are testers on the market which are said to tell the sex of anything alive—fowls, pigeons, rabbits, eggs, plants or bulbs.

A reader of the Journal recently sent us one of the testers to try. We had set a hen and thought that it would be interesting to test the eggs and then, later on, count the cockerels and pullets in the hatch.

An examination of the tester revealed a simple construction. It looked a little like a brick layer's plumb, suspended from a cord; and the cord was fastened to a spool, which was to be held firmly in the hand of the person doing the testing.

If the object tested was infertile the plumb was to hang perfectly perpendicular and without motion. If the object was a male, the plumb was to swing around in a circular motion. If the object was a female, the plumb was to swing backward and forward, like a pendulum in a clock.

We tried two eggs. It indicated that one would produce a cockerel and that the other would produce a pullet. The motion of the plumb was so violent that

it seemed incredible that so minute and microscopic a thing as a fertile germ in an egg could bring about such astonishing response.

Here we stopped to make a tester of our own. Cutting a piece of cardboard in the fashion of an Indian dart, we suspended it from a spool, with a piece of thread four inches long. Upon holding the spool firmly in the hand, the same motions were secured from the dart-shaped piece of cardboard.

There was nothing scientific in the construction of this home-made affair. The fact that it performed indicated that there were no unseen or unknown forces of life in the tester, and that its movements must be altogether due to mental expectations and mental influence on the hand of the person holding the tester.

To demonstrate that the motion was due to psychological influence, we backed two chairs together and suspended the tester from them. We put our hand under it, and there was no movement. This seemed to demonstrate the need of the pulsating action of a man's hand in order to secure motion from the tester.

We picked up the tester and held it over a table, and put everything out of our mind except circular motion, and it responded; then we changed its motion quickly by concentrating on perpendicular motion. It responded to expectations like an Ouija board.

Then we got the baby's rubber doll with a dress on it, his woolly dog stuffed with cotton, and his doll rabbit. They were laid on the table and we held the tester over each one of them in turn. Perpendicular motion indicated that the rubber doll was a female; circular motion indicated that the dog doll was a male; about the rabbit there was a moment of hesitation and then the plumb began to swing in a circle, indicating a papa rabbit.

We stopped. We did not bother the setting hen to test her eggs.

We shall be glad to print more prominently than this item, and without any charge, an authenticated report from any state experiment station which outlines a practical system for determining the sex of eggs before the eggs are incubated, or any system that will determine the sex of baby chicks.

A number of so-called sex indicators are being advertised and offered for sale. American Poultry Journal has refused hundreds of dollars worth of such advertising. From our examination of two of these testers, we believe them to be a humbug. If any one wants to experiment, we recommend that they keep their money, and make a home-made tester by tying the stub of a pencil on a thread.

Impossible to Print Full Awards of All Shows.

A number of poultry show secretaries have favored us with reports of their respective shows together with complete lists of awards. We regret our inability to publish these reports, and perhaps some explanation of our position should be made.

It would be a mechanical impossibility to print all the awards of all the shows. The number of pages limits the amount of reading matter that any issue can carry.

Every inch of space for reading matter cannot be allotted to show reports,

The Letter that Saved Me 36% on Typewriters

Received by a Business Man from a Buyer Friend

Chicago, Nov. 2, 1920.

Dear Henry:

I hear that you are down in New York to open a branch office for your firm. You'll be buying a lot of things for the office, not the least important of which will be typewriters.

And that's what I want to talk to you about—typewriters. I want to give you the benefit of an experience I had some time ago, and thereby, I hope, save you some real money.

About a year ago I decided to buy a typewriter for home use. My first thought was to purchase one of the makes we were using in the office, which had been put in before I became buyer for the house. But when it came to digging up a hundred dollars for the machine—I just couldn't. Somehow or other it looked like too much money to me.

Then I thought about picking up a second-hand machine, but the price was about as high, and I had no assurance of service.

I was undecided as to what to do, when one evening at home I ran across an Oliver Typewriter ad in a magazine. I remembered then having read the advertising

before and being impressed with the story.

"Why pay \$100 for Any Typewriter"—"When You Can Buy a New Oliver for \$64?" read the ad—then it went on to explain how The Oliver Typewriter Company had cut the price by selling direct and eliminating costly selling methods. It was clear to me as an experienced buyer how they could well afford to top off \$36 of the \$100 by their new economical selling plan.

The ad brought out the fact, too, that I didn't have to pay the \$64 in a lump sum. I could settle at the easy rate of \$4 a month. Naturally that appealed to me, for it was as easy as rental terms.

But the thing that decided me was their free trial offer. Without my sending or depositing a penny, they would ship me an Oliver for five days free trial. I could use the typewriter for five days just as if it were my own, and if I wasn't satisfied, all I had to do was to ship it back at the Oliver Company's expense. Well, I mailed in the coupon and got an Oliver for free trial. To make a short story shorter, I

was more than pleased with the Oliver. I fully agreed with The Oliver Typewriter Company that if any typewriter was worth \$100 it was this splendid Oliver.

Well, later when we found it necessary to replace some of the typewriters at the office, you may be sure I put in Olivers, saving the company a nice \$36 on each. At first the girls were reluctant about changing machines, but after a week or two with the Oliver, they wouldn't have any other.

Naturally now we are all Oliver enthusiasts—that's why I write this letter to you.

You just give the Oliver a trial and you'll be more than willing to buy me a good dinner when I arrive in New York next month.

Yours, J. B.

That is the letter that saved me \$36 on each of my typewriters. I not only equipped the office with the Oliver, but like my friend I also bought one for home use. Yes, I am more than willing to buy my friend a good dinner for his valuable advice.

Any reader may order an Oliver direct from this ad by mailing the coupon. No money in advance. No deposit. No obligation to buy. Return or keep the Oliver as you decide after five days free trial. If you decide to keep the typewriter, you may take a year and a half to pay at the easy rate of \$4 a month. Avoid disappointment. Order now to secure immediate delivery.

Solving the Brooding Problem

It is when you are breeding pedigreed birds that you realize that every chick put under the brooder must have exceptional care. Every bird will be worth big money if you can only give it the right start in life. That is when you must look into your brooding problem.

You can't afford to take any chances. You must know that your brooder is the right one in every respect. That there is no danger of losing a big hatch through some faulty brooding system. The greater the percentage raised to maturity, the greater the profits for you.

And when big breeders like Owen Farms say that one brooder is the best, that surely means something. And Mr. Delano, of the Owens Farms, the World's Greatest Poultry Farms, did say that the

International Sanitary Hover

is the best hover he ever used. And he has used them for over seven years.

Portable, warmest at the curtain, the only hover with a canvas curtain that the chicks cannot eat. Perfect ventilation for the chicks at night without any drafts. Fireproof and vermin-proof.

No carpenter work necessary to use the Sanitary Hover. No cutting of holes, building of boxes or platforms nor expensive brooder houses. It is the one self-contained hover. To set it up, just set it down.

And it is guaranteed to raise a higher percentage of chicks entrusted to its care than any other brooding device.

Made in only the Sanitary Size, 28-in. Diameter, 100 Chicks. Price, Complete, \$18.00.

Poultry Supply Dealers sell the Sanitary Hover. Write us for catalog that shows you why the Sanitary Hover is the "Perfect Brooding Device." It solves the brooding problem.

**The One
Perfect
Brooding
Device**

INTERNATIONAL SANITARY HOVER COMPANY

411 A Washington Avenue, St. Louis, Mo.

Eastern Distributors—Cyphers Incubator Co., Buffalo, N. Y.
Western Distributors—Germain Seed Co., Los Angeles, Cal.

even in the height of the show season, for a balance must be held between show news and articles on the everyday side of practical poultry keeping. Those who buy the Journal expect to, and should find, articles on the practical phases of poultry culture somewhere within the pages of the publication.

When it comes to selecting what matter shall appear, the national character of our circulation must be constantly borne in mind. American Poultry Journal is not a poultry newspaper more or less local in character. It is a magazine of national circulation. It has as many subscribers in Michigan as in Massachusetts.

It follows that articles of an educational nature must carry as much value for the reader in Michigan as for the reader in Massachusetts; or if the article is of a news nature, such as a list of prizes awarded at a recently held poultry show, the show must be of national standing if the awards and comments on the classes are to be read in all sections of the country with equal interest.

We have, therefore, confined our show news to reports of the poultry exhibitions held in Kansas City, Chicago Coliseum, Boston and New York. We have gone to considerable expense and trouble to give the readers of the Journal thorough-going reports. We have printed the awards regardless of whether the owners of the winning birds were advertisers in these columns or not. That the policy has met with general approval is unmistakably indicated by the number of complimentary letters that we have received.

Harold Tompkins Discusses Rhode Island Reds.

Harold Tompkins is a pretty good man to talk with about Rhode Island Reds. His grandfather, living in the Little Compton district of Rhode Island, had some of the early red stock. Some of the original Red Game males, brought by whalers from the East Indies, were secured and bred by his grandfather as early as the Sixties.

His father, Lester Tompkins, helped to establish Rhode Island Red type. The grandfather died when Harold was eight years old. The modern type of the breed was established about 1900, in Harold's school days, and the whole progress of the Red, as a Standard fowl, is well within his memory.

During the Garden show, we had a long talk with Mr. Harold Tompkins. He spoke of the first prize cock in the Single Comb Red class, in the Garden, as representing his ideal type, except that he would prefer a little more drum stick. This cock was the outstanding first cockerel of last year, and he had filled down in breast and body, making him a trifle short in station. Continuing Mr. Tompkins said:

There is only one way to tell the right length of the thigh on a Red. I want two fingers of space above the hock joint, before you touch the fluff. Of course, if such a bird is too long in shank, from hock down to toes, that will make him too high.

I want the back horizontal. The underline of wing should be horizontal, parallel with the back line. The underline of the keel should also be parallel with the back. This makes three distinct horizontal lines.

You will find that if a male carries a keel as long as the span of your hand from outstretched thumb to end of outstretched finger, you will have good length.

ANDREWS CARRIERS

For Baby Chicks

Three sizes, for 25, 50 and 100 chicks. Built to conform to International Baby Chick Association specifications. Car lot orders made to meet buyer's specifications. Strongly built of heavy corrugated board—waterproof inside and out—shipped flat—set up in a jiffy. And they carry the chicks in comfort and safety.

Andrews Carriers are made in one of the world's greatest box factories. We can promptly make shipments of any quantity—from two dozen of a size up to a carload. And our prices are surprisingly low. Andrews Carriers are right. "Ask the Judges." Write now for complete catalog.

For Eggs

Ten sizes—ranging from 12 to 120 egg capacity. These carriers absolutely prevent breakage. Further, they protect the egg-contents by preventing shocks. Each egg protected by several thicknesses of corrugated cushions. Simple and practical. Can be used many times, but cheap enough to throw away after a single trip.

O. B. Andrews Co., Dept. A, Chattanooga, Tenn.

What's a CAPON and Why?

A book that explains everything you will ever want to know about CAPONS. 50 pictures from life that show each step in the operation. List of Capon Dealers' addresses. Tells how to prevent "Slips" where to get the best and cheapest capon tools. Capons are immense eating. Big profits realized. Get wise. This book tells how. Copyrighted new and revised edition. Regular 50c copy, prepaid to your address (a short time only) for a Dime in coin or stamps. **GEORGE BEUOY, R. R. No. 7, CEDAR VALE, KANS.**

"DANDY" BONE CUTTER

You needn't pay one penny for this bone cutter until you try it and it satisfies you. Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy Green Bone Cutter cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood, feathers. Our terms on the Dandy Bone Cutter are:

No Money In Advance—15 Days Free Trial

The Dandy costs less than most bone cutters and it works infinitely better. Also cuts meat, vegetables, roots, etc. To ensure big sales this year we have made special reduction in prices. Write quickly for free booklet. Prices are liable to rise next month, owing to big demand for raw material. **STRATTON MFG. CO., Dept. G, ERIE, PA.**

Red breeders do not pay as much attention to the arch of neck as do the Wyandotte men, but if a Red male has a long slim neck it will also have a long, snaky head. If the neck is nicely arched down to the butts of the hackle, you get a good head.

If you get them right in thigh, you usually get them right in neck. A long legged bird usually carries his head away up, to balance himself. This makes a long neck.

The tail, according to the Standard, should be carried at an angle of 45 degrees. If that were reduced, and the tails pulled down to 30 degrees, and everybody would breed for the lower tails, the result would be a more symmetrical chicken. As it is, many breeders will mate a high tailed bird, provided he is otherwise a good one.

I do not want a bushy tail, and I do not want a loose, wobbly tail. I want a tail that is well set. If you breed a loose tail, the first thing you know some of the cockerels are carrying tails to one side.

Width of tail depends on width of back. A Red male with a wide back will carry a wide tail nine times out of ten.

I want breadth and substance. I do not like a narrow, razor back. If you put your two thumbs over the hips of the back, thumb to thumb, and the tips of your index fingers will not meet together behind the thighs, as you span the body of the bird with your hands, you have a good bodied bird. I like that type of body which I cannot span by two inches.

If the legs are too long, you lose depth and you lose width. In other words you

A duck's legs are so far behind that the duck throws its head up and its back down. To get a level back in a R. I. Red, Harold Tompkins points out the necessity of having the legs come out of the middle of the chicken so it will balance evenly on its legs.

have a 'two years' bird,' that is, a bird that must go through the molt before filling out in body in proportion to its height.

Too many breeders are careless about the formation of the wings. They are chasing color so strong that they do not think about anything else. If these breeders would pick birds with wide flight feathers, they would quickly eliminate slipped wings from their breeding. I do not mean to say that they would not get a single slipped wing, but that they would not get a number of them. I want the wing long, the flight feathers long and wide, and the web of the feather heavy.

In the matter of balance, it is important to consider where the legs come out of the body. I do not want the legs set at the back of the body. Such a bird runs his head up into the air and his back down, like an Indian Runner duck whose legs come out of the very rear of its body. Such a bird cannot hold his back level; he has too much weight forward of his legs, and in order to balance himself he throws his breast up and his head.

I want the body well balanced on the legs. I never saw a male whose legs came out of the middle of his body that did not carry his back balanced right. Remember to look and see where the legs come out of the body.

This is an easy matter to handle. There are two ends to a Red. If you will pick hens that have two ends, breast and stern, you will breed level backs.

Baker's Buff Rocks Won Every First at Kansas City and Chicago

Egg record, Leavenworth, 214; Mountain Grove, 229. 2,000 chicks growing. Best Buff Rock catalog ever issued FREE.

O. R. BAKER, Box A, Abilene, Kansas.

THE LORD FARMS

S. C. WHITE LEGHORNS

For ten years we have been steadily advertising White Leghorn Day Old Chicks. What is the verdict of the American public? Ten years ago we were using a 3,000-egg incubator; today our capacity is 103,600. Ten years ago we raised about 2,000 chicks for ourselves; this year we shall raise at least 40,000. Lord Farms Leghorns have certainly made good. This year, like all other years, it will simply be a question of how many we can produce.

Isn't That the Kind of Stock You Want?

Stock that is in demand, that there is no experiment in buying. Stock that you know the public are making money with and not taking chances.

We don't know whether we have the best Leghorns or not, but we surely know that we have got good stuff. If you buy your chicks from us you will get chicks that live and make uniform growth. Next winter you will be more than pleased with your returns in eggs and the quality of the same.

Order Your May Chicks Now

May is the very best month of the entire year for hatching Leghorns. If you wish March and April hatches, sit right down and write us at once.

	Grade A.	Grade B.
25- 49 chicks30	.27
50- 99 chicks29	.26
100-499 chicks28	.25
500-999 chicks27½	.24½
1000 or more27	.24

SPECIALS

These are our highest grade and sold only in limited numbers. No orders taken for less than 25 and no orders taken for more than 100 lots at a flat price of FIFTY CENTS PER CHICK.

Hatching Eggs about one-half price of chicks.

8 to 10 Weeks Old Pullets

Thousands for Sale This Year

All raised on our new 260-acre, sandy loam farm in Tewksbury and Andover. All raised in brand new houses, under absolutely clean, sanitary conditions, and all Lord Farms bred. Five thousand February and March hatched pullets ready for shipment about May 1, and thousands for later shipment.

BE SURE AND GET OUR 80-PAGE CATALOG. ONE OF REAL INFORMATION TO THE LEGHORN BREEDERS AND BUYERS.

HERE ARE SOME OF OUR TESTIMONIALS.

Ridgeview Farm, Adrian, Mich.,
Jan. 31, 1921.

Look on your books way back five years ago, you will find "yours truly" ordered 500 baby chicks. They were the foundation of my "200 egggers," and I have always had a good word for the Lord Farms. I have a pen of "5-finger" hens that I want to make up to a "heavy duty" cockerel from you, etc.

E. T. CROWE.

East Aurora, N. Y.

Please accept my order for 100 Grade A chicks for April 1. Last year I purchased 100 Lord Chicks, only lost five, raised 63 pullets. For the past three months they have laid 80 percent, and I want Lord's again.

MRS. BERTHA B. STOCKIN.

Glen Falls, New York.

Please send catalog and price list for day-old chicks. Last year ours averaged 187 from a pen of 24 from Sept. 8, 1919, to Sept. 7, 1920.

CHARLES F. MITCHELL.

Cleveland, Ohio, January 25.

Please pardon me for not letting you know the birds got here "O. K." on Saturday, the 15th, but I wanted to wait until after last week, when I showed the exhibition bird. I am glad to let you know that we got 2d with him, beating the third cockerel at Cleveland. Not so bad. We are very well pleased with all three. Thanking you for prompt delivery and good birds. Will always have a good word for you.

ED KEELEY,

Oldoaks Poultry Farm.

Keene, N. H., Aug. 22, 1920.

I have had splendid luck with my chicks. Out of the 500 I raised 320 pullets and have 160 roosters or cockerels. I lost only 20.

LESTER E. SARGENT.

Yarmouth, Sept. 23, 1920.

The 500 I bought of you last February had the smallest percentage of runts and weaklings of any lot I ever handled.

BUCHANAN BURR.

Winsted, Conn., May 2, 1920.

Of the 200 chicks I got of you a year ago I have 94 pullets, and during the past month got 1,945 eggs.

MATTHEW G. CARROLL.

These are only a few of thousands and thousands of testimonials we have received for our stock. We could show testimonials of customers who have received as high as 202 eggs a bird for an entire flock, but we don't believe in advertising too high egg strains. Customers don't have to get 202 eggs per bird to make money in the Poultry Business.

"LADY BEAUTIFUL"

PULLET LINE ONLY.

BARRED PLYMOUTH ROCKS

OLD LADY BEAUTIFUL was perhaps one of the two greatest females yet shown at Madison Square Garden. Her progeny has produced and reproduced until my pullet-bred line (and which, by the way, is all I breed) has attained its present high position among the various strains of Barred Rocks.

At State and National Meets of the American Barred Rock Club the "Lady Beautiful Strain" has won high honors.

LADY BEAUTIFUL birds won at Baltimore as follows: 1st, 3rd and 5th hens; 1st, 2nd and 5th pullets; 1st and 3rd cocks; 1st and 2nd cockerels.

STOCK—Always some choice pullet-bred males for disposal to the discriminating purchaser.

C. N. MYERS Box A HANOVER, PA.

Tarbox's Silver Wyandottes and Speckled Sussex

Our Silvers again win the most coveted prize—Best Display at the Club Show, Milwaukee, Wis., Nov. 24-26, 1920. On Speckled Sussex we won five 1st and two 2d on seven entries; Red Sussex four 1st on four entries. At the Chicago, Coliseum Show, Dec. 1-6, 1920, we won on Silvers, six 1st and four 2d on 10 entries; on Speckled Sussex, 4th cockerel, 5th pullet and 3d young pen. A few Red Sussex to close them out at bargain prices. Get our prices on Silvers and Specks before placing your orders.

A. & E. TARBOX,

Box A,

YORKVILLE, ILL.

Now as to color. The fancy is too dark to suit me. Take any Single Comb cock or cockerel that is under the ribbons in the Garden today and put him 100 feet away from you, against a sheet of American flag red, and he will look black. If you put him against a sheet of black cloth, at that same distance, he will blend in with the black.

The right color in a Red stands out at 200 feet distance.

Color is a hard thing to describe. You cannot say that it is cherry, or bay or chestnut. The Standard calls for rich, brilliant red. It is hard to figure out exactly what that means, yet I presume it is as good a description as can be reduced to words.

There is a difference of opinion on rich red, but all want the brilliance. Even the admirers of a dark red agree on brilliance or sheen.

My first prize Single Comb Red cockerel at the last Boston Show suits me. The red color on him sticks out in beads and scintillates right out of the under color.

I do not want a color that looks black when you see a bird half way across the field. I want the color to match all over. Of course, you cannot get the same sheen and luster on male's breast and fluff that you can on back, neck and wing bow, but I want the same shade of red.

I do not mind ticking in the hackle as long as it is ticking and not lacing. Ticking is not distinct; you have to handle the bird and examine the neck feathers to find it. The best birds have some ticking.

Weakness in the undercolor of the male's hackle feathers is one of the worst things that can be bred. I would rather have a bird sound in undercolor of neck than one whose neck exactly matched his back.

There are two ends to a bird as regards color just as they are in shape. I do not want weakness in the fluff at the butt of tail, where the back and tail join.

There is often criticism on weakness of color over the hips. That is, in reality, over the kidneys. Many a bird that catches a little cold in the fall, as a result of too close housing, lack of green food, or for some other simple reason, is held back in his feather growth, and the result is a little white over his kidneys. Many a good bird shows it; and if a male is good at base of hackle and at butt of tail, a little weakness in the undercolor over the hips may be laid to some cause other than color weakness.

I want the saddle feathers wide. The ends of the long saddle feathers should match the ends of the hackle feathers. The wider you can get those saddle and hackle feathers, the more redness, the more weight of color, the more levelness of color will you secure.

Some fellows are color blind. They look at a bird and think that the ends of the saddle feathers are of the same shade of color as the top of the back, when they are not. The second Single Comb Red cock here at New York is the same bird that won third at Boston three weeks ago, and he is absolutely of one shade of color over back and saddle. And, he has one kind of feather, not a wide feather on his back and a narrow feather in his saddle.

It is easy to get sheen and high color on the wing bows; but if a bird carries the same quality of feathers in his wing bows that he carries in his back, you will usually find that he runs pretty even across his wing bows.

The wing coverts, which form the wing bar, should be just as red as the rest of the bird. Frequently some ticking shows here. A well-informed judge expects to see a little of it. If it is bad, however, it should not be pulled, for to pull it would leave a hole in the wing-bar that does not cover.

The red in the flights should be as near the color of the fluff of the bird as possible. When you open the wing and lay the flights across the fluff, they should match. There is no sheen in the red of the flights and they cannot be compared with the back.

The breast should be free from a light colored quill running through the center of each feather. As the breast comes down toward the fluff, it wants to hold the same rich tone of color.

The fluff should have as much color down to the skin as possible, including a red quill.

What is a bird worth such as you have described?

They are not on the market. In other words, the bird I have described is what every breeder should be trying to produce. If a man could raise birds of this kind each year, he could sell them as fast as he could ship them at \$300 each. They are coming, a few more each year; but the fellows who are doling them up are not trying for them.

How do you go about it to produce such chickens?

You can produce them if you get the right female. I am fussy about picking out females. Some fellows pick out females by their toe marks, to get all sisters in a pen. I want sisters provided they are right.

I want a hen that was good as a pullet. She wants to be as dark or darker in hackle than her darkest hack feathers. Black in her hackle does not mean dark, for black is not red. Cherry red in hackle is not dark. I am talking now about a dark neck on the female and want to emphasize it. I also want a nice broad feather in the hackle.

This hen may be a little mottled in back, and the breast may be uneven in color, but the deepest colored feathers are of a good pullet color; and all feathers, including the mottled ones, must carry a rich, deep red undercolor to the skin. This hen may look bad because of mottled feathers on surface of breast and back. But she has hackle and undercolor, and they count. If she has a little slate, it does not hurt, as long as the red undercolor is red and not silvery.

Do not pay so much attention to the tail of the female. Some hens show black and red in tail, or are what you would call streaked. Of course, if the hen is slatey, she will have a black tail. You have to balance the tail on the male side.

The web of the feathers in the wings should be red, unless the male is weak in black markings.

Do not breed a male with smut. The little smut I use is always on the female side. I get along pretty well without the use of smut, because I pick breeding males largely by their second set of chick feathers. They grow three sets of feathers, and when the cockerels are four months old, I go over them, and those that show smoke, which later clears up and goes into the show without a lot of plucking—are the males I breed.

That slate in their blood is a color feeder. This feeding of iron for color puts a bar on the bird. But, take these males as described and breed to red females, free from smut, and you have strong color breeders.

Select a male whose breast feathers are of the same color and quality and match the reddest feathers in the hen's back. If she carries a broad feather, he wants to have the same kind. Nine times out of ten she will carry a broad feather if she is one of the right kind of birds. Little, narrow feathers have no quality.

In the above interview, Harold Tompkins gives what we believe to be the best outline for breeding Rhode Island Reds that has been published to date.

Mr. Tompkins answered every question put to him freely, frankly and fully. He was not afraid of telling "too much."

We suggest that every breeder of Reds cut out this editorial and read it again next year, and the year after that, for the more he sees and understands about Reds, the more he will learn by reading and re-reading what Mr. Tompkins has here said about Reds.

Roosters.

R. G. Grant, in his book on "Words and Their Uses," says:

A rooster is any animal that roosts. Almost all birds are roosters, the hens, of course, as well as the cocks. What sense or delicacy, then, is there in calling the cock of the domestic fowl a rooster, as many people do? The cock is no more a rooster than the hen; and domestic fowls are no more roosters than canary birds or peacocks. Out of this nonsense, however, people must be laughed rather than reasoned.

Brood Your Chicks with a Hen

Nature-Plus has solved the brooding problem for 50,000 poultry raisers in the United States and foreign countries, and is fully capable of solving yours. G. F. Kiessel, N. Champa St., Boone, Iowa, says: "I would not surrender the right to make and use Nature-Plus for \$500." H. A. Gray, Route 2, Fennville, Mich., writes: "It is far more successful than any artificially heated brooder I have ever seen." The Nature-Plus Hover is a practical combination of your hen and our hover. It will enable your hen to brood 150 to 200 chicks as safely as she could brood a dozen without the hover. No artificial heat, no danger, no expense. Patented in United States and foreign countries. Easily made with simple tools. Plans and rights sold to users under money-back guarantee. For further information, address,

NATURE-PLUS COMPANY :: HILLSBORO, OREGON

KILLS EGGS FOR HATCHING

Many fanciers now use Egg-O-Latum, the great egg preserver, on all eggs sent to market. It prevents the all too common practice of the pirates who watch the grocery store or the egg buyer and obtain high grade hatching stock at market prices. And consumers, who understand, will pay higher prices for fresh eggs prepared with Egg-O-Latum because they know the eggs keep fresh until used, whether a few weeks or one year. Egg-O-Latum is a soft, white, cerate wax, odorless, tasteless, harmless. It is applied by first coating the palms of the hands, then rolling and rubbing the eggs in the hands. Five seconds enough for each egg—a dozen a minute. When eggs are to be sent at once to local market, wipe them well with a dry cloth. Enough remains in the shell pores to prevent hatching and keep them fresh for months.

From the Editor of Reliable Poultry Journal—"Can recommend Egg-O-Latum as an egg preservative that is economical and easy to apply and it does the work."—Grant M. Curtis.

Endorsed by National Housewives' League—"At a meeting of the Executive Committee of the National Housewives' League held Wednesday, June 19, 1918, the matter of endorsing Egg-O-Latum came up before the Committee. I have been instructed to write and say that we believe Egg-O-Latum to be a very good product and same has been passed by the Executive Committee."—Mrs. Sara O. West, Recording Secretary.

Kept Eggs Eleven Months—"I am delighted with the Egg-O-Latum and now using eggs that were packed in it eleven months ago."—Mrs. I. W. Morgan, Eutaw, Ala., L. B. 125.

From a Warm Climate—"I have tried the Egg-O-Latum and found it to preserve the eggs in good shape for more than six months." P. D. DePool, Havana, Cuba.

Keeps Good for 20 Months—"I have never used anything that came up to Egg-O-Latum for keeping eggs. I got a jar in August, 1918, and the eggs I rubbed with it are still in excellent condition to use. I was careful to turn the boxes as directed up until last spring. Since that time they have had no turning or care whatever. I consider it far superior to water glass. Lizzie H. Daniels, Simeon, Neb. Beaver Lake R. R., April 2, 1920.

A 50c jar is enough for 50 doz. eggs. A \$1 jar for 200 doz. If no dealer, order by card. Postman will collect. No extra charge. Handy as 'phoning.

MILFORD, MASS.

Free Book Tells How

Solving the Chinese Puzzle by Putting a High Tariff on Eggs.

The Republican party is definitely committed to a tariff that will increase the duties on imported goods, in order to protect goods which are produced in the United States from cheap foreign competition.

The great manufacturing nations of Europe are desperately striving to make goods and find markets for them in other countries. These nations are poverty stricken. In 1914 and 1915 they shipped all their gold to the United States, for they were engaged in war and they needed to buy large quantities of things from the United States. In 1916 and 1917 they had run out of gold but they had not run out of war, so they sent all their securities to the United States to cover their purchases. At the end of the war they had enormous quantities of paper money behind which was neither gold nor securities, and they owed fabulous sums on bonds that they had floated.

Somehow they have got to get back some gold and securities. They levy a great bill of reparations on Germany, but Germany has nothing but paper money with which to pay. In order to pay, Germany must get to work, manufacture and sell goods, and in this way get some gold.

France wants Germany to pay, but she wants Germany to get the money with which to pay by selling goods in Britain. England wants Germany to pay, but with so many Englishmen out of work, she cannot absorb the German goods. She would rather that Germany would sell her goods in the United States and thus get American gold with which to pay her debts to France and Britain.

One thing that the new Republican administration will not permit is the dumping on us of goods of foreign nations. Wholesale quantities of foreign goods offered for sale in our markets would mean an intolerable condition for American labor. We cannot bring our standard of wages and living down low enough so that American workmen are on a level and can compete with the hungry, impoverished, war-stricken workmen in foreign countries.

To save our markets for ourselves, an emergency tariff bill was introduced into the present congress.

Indications were that this hastily written bill would fail to pass, and according to information from a confidential source, Mr. Harding was to call a special session of Congress early in April, when a new general tariff bill would be immediately introduced.

Poultry products are not included in the Emergency Tariff Bill. Poultrymen made their drive to get eggs and poultry meat taken care of in the General Tariff Bill which was to come up early in Mr. Harding's administration. However, Jas. E. Rice wired us under the date of Feb. 13:

Emergency Tariff Bill may pass Senate this week. Does not include eggs or poultry. Amendment will be offered to give proper protection to poultry industry. Oriental competition alarming and increasing. We must move quickly and vigorously.

Mr. Rice then went immediately to Washington and took quarters in the Congress Hotel.

During the last week in January, the following poultrymen were in Washing-

ton, D. C., preparing their case and presenting the same to Senators and Representatives:

Harry Collier, representing the Department of Agriculture of the State of Washington;

James E. Rice, Professor of Poultry Husbandry, New York State College of Agriculture;

John Lawler, representing the Central California Egg Association;

C. H. Burnett, Washington Co-operative Egg Producers' Association.

These men based their work on Oriental eggs, which are the cheapest eggs in the world. They presented their arguments to the Ways and Means Committee of the House of Representatives, a committee that had charge of gathering information on the tariff for the new Congress.

Harry Collier furnished us, in the few hours that we spent with him when he presents to the Ways and Means Committee the following salient points that the committee of poultrymen presented in their brief to the Ways and Means Committee:

A Chinaman can get eggs ready for export at six to ten cents per dozen. These eggs can be shipped by boat from China to New York as cheaply as eggs can be shipped by rail to New York from principal points in the United States.

A recent shipment of eggs from China, which reached New York by way of the Panama Canal, consisted of 6,000 tons. The value of these eggs was \$7,000,000. No cargo of gold from the Klondike was ever as valuable as that Asiatic shipment of eggs. The little vessel that steamed into Seattle some years ago, the news of which started 100,000 Americans on their rush to Alaska, carried \$3,500,000 worth of gold.

The value of this one cargo of eggs from China was equivalent to one-third of Petaluma's annual production of \$22,000,000 worth of eggs.

Chinese eggs that reach the Pacific coast and are then carried across the country by rail, go to New York from San Francisco, for \$2.30 per 100 pounds. The transportation to New York on eggs produced by Americans in California is \$3.33 per hundred, which is \$1.03 more, or 31 percent.

The imports of eggs to the United States in 1914, amounted to \$1,577,000. The imports in 1920 amounted to \$16,268,000.

Eggs in China are produced in April, May and June, the same season when we have the heavy egg flow in North America. These eggs are produced when we have a surplus, not when we are short.

Australia has met the foreign egg problem by putting a duty of 12 cents a dozen on eggs.

Our committee has recommended a tariff of 12 cents a dozen on eggs in shells and 15 cents a pound on frozen or dried eggs. It takes about 14 Chinese eggs to make a pound.

The powdered egg product now sells in the United States at \$1.10 a pound and a pound is said to be the equivalent to three dozen eggs in the shell. Bakers and restaurant men like to buy the egg product, and there is a big market for it.

The Chinese egg, however, cannot stand publicity. When the law requires, as it does in the State of Washington, that restaurants which use Chinese eggs shall display a sign to that effect in a conspicuous place, and the lettering on that sign shall be not less than four inches high, the restaurant man immediately quits buying Chinese eggs. The hens in China are fed no grain, and according to a witness before the supreme court in Washington, live largely on human excrement. So strong is the prejudice against Chinese eggs that, on the coast, patronage falls off in a restaurant that admits using them.

Unfortunately the supreme court of Oregon and California have declared invalid similar laws which would require users of Chinese eggs to put up signs to the effect, and the

UHL'S DAY-OLD CHICKS

THE PIONEER MAMMOTH
CHICK HATCHERY
Our Twenty-first Season

The largest and oldest successful hatchery. We produce chicks from free range stock that are strong, vigorous and full of pep. Years of experience have taught us how to hatch chicks that are satisfactory to our customers. If you want the best, we have them, all pure bred and at the most reasonable prices. We have the most popular varieties.

FRAUDULENT RECEIPT ISSUED BY J. BEVANS.

supreme court of Washington alone has maintained that such a law is valid.

A tariff is the thing to hold back these eggs. A tariff will apply to all the states, for it is the action of the Federal Government. It will also hold back the Japanese eggs, which are larger, of better quality and make still keener competition in our markets.

In addition to the tariff on eggs, our committee recommended a duty of 7 cents a pound on dressed poultry and 4 cents on live poultry.

Poultry in this country does not need foreign competition. Let us build up the prosperity of our own poultry producers. Let us build a tariff wall so high that the Chinaman will stop at our border and take his eggs back to feed the starving thousands in his own provinces. It is ridiculous for China to ship 6,000 tons of eggs to New York in one cargo, and then cry for food and money from America to feed her starving people.

\$25.00 Reward.

American Poultry Journal will pay \$25 to any one anywhere within the United States who causes the arrest of J. Bevans, alias J. H. Bevans and J. A. Bevans; it being further required that a telegram shall be sent to us, charges collect, notifying us of his arrest.

We are reproducing herewith a fraudulent receipt issued by said Bevans for

a three years' subscription to American Poultry Journal. We do not furnish such receipts, and no agent is authorized to take other than four-month trial subscriptions.

Bevans not only started a "reading club" for poultrymen in and around Kokomo, Indiana, but he played a confidence game on the Kokomo Poultry Association by attending their meetings

OFFICIAL RECEIPT ISSUED BY AUTHORIZED AGENTS OF AMERICAN POULTRY JOURNAL. ANY OTHER RECEIPT IS FRAUDULENT.

in January and posing as a representative of the American Poultry Journal. He explained a method which, according to his misrepresentation, the Journal had for conducting poultry shows, and was given authority to go ahead with the Kokomo exhibition.

He established headquarters in the Martin Hotel and began writing the poultrymen in Howard county for entries for the show and subscriptions for the Journal. Entries came in rapidly, accompanied by entry fees. It is reported that about \$500 in entry money was received by Bevans. We do not know how many dollars in subscription money were received by him.

Before the show was staged, Bevans left the town, bag and baggage. The officers of the association unearthed enough facts to find that they had been flimmed. A hurried meeting of the association was called, and it was decided to go on with the show, in order to keep faith with the poultry breeders who had made their entries. The loss occasioned by the disappearance of Bevans was borne by the officers who put him in charge of the show.

American Poultry Journal would like to locate said Bevans, hence the reward for his arrest.

We reproduce on this page the fraudulent receipt issued by J. Bevans to a breeder in Kokomo, Ind., for the sum of \$2 received for a three years' subscription. As protection to the public, we also reproduce herewith the official receipt issued by authorized agents of American Poultry Journal. No other receipt is valid.

As a final word: The secretary is the whole works in a poultry association at show time. He has the entries and entry money, and exhibitors, judges, feed dealer and coopman look to the secretary for the details of the show. He puts across the entire load of show week. Pick him like you would the timbers for a bridge. If you are unable to put all your dependence in him, you had better "stay off" of him.

There is always a tendency to elevate the new member of a church, to take in and entertain and counsel with the new personality that has taken up residence in the town. Poultry associations often fail in their business affairs because they elect officers about whom they know too little. The glib talker or happy personality may not be a fit secretary.

It is reported that W. D. Holterman furnished the 1st prize hen at the recent meet of the American Barred Plymouth Rock Club at Kansas City.

Purina Chows Will Save Them

THOSE fluffy little beauties are just as tender as human babies. Don't try to raise them on whole grains, meal, stale bread and such grain products. Such feeds are just as unsuited to a chick's delicate system as corn bread would be to a baby. A large percentage of grain-fed chicks die of bowel trouble, and the ones that do live develop slowly and feather out badly. Any grain ration alone has too little protein for lean meat and feathers, and too little minerals for bones. Chicks can't develop right on such a diet.

Chicks Saved Pay Feed Bill

Feed those downy little balls of fluff properly and you will raise more and better chicks. Suppose you save only two more chicks out of every dozen you hatch. That alone will pay your feed bill. But you can accomplish much more by correct feeding. When you feed Purina Chows your chicks will start right off growing and feathering out from the very beginning, and they will keep it up.

T. M. AGNEW, Box 429, Blue Mound Road, WAUWATOSA, WIS.

CURRENT NOTES AND COMMENT

The Hatching Season.

The remarkably mild winter presages an early hatching season.

Cockerels, particularly, should be hatched reasonably early if they are to enjoy a growing period sufficiently long to enable them to reach the winter shows not merely up to weight requirements but well finished in plumage. This finish is necessary if a male is to be well rounded out and appear truly masculine.

We look for heavy hatching this year, and more well developed birds the coming fall and winter than usual.

* * *

Hardly Consistent.

In a Golden Wyandotte male, red at the base of the feather is not considered a defect. In fact, it is looked upon as adding to the breeding value of the bird. The Golden Wyandotte is black and red.

In a Silver Wyandotte male, which is black and white, more than half the judges will tell you that white at the base of the neck and back is a defect. This White in the Silver corresponds to the red in the Golden, and is also of breeding value when it comes to the production of open laced females.

Why should white in the under color of a Silver Wyandotte be considered a defect, while red near the skin of a Golden Wyandotte's top plumage be looked upon as enhancing the breeding value of the bird?

* * *

A Nebraska Note.

Because of other business, M. G. Scudder has resigned as secretary of the Nebraska State Poultry Association. Mr. Scudder has served as secretary during the past four years, in which time he has shown a remarkable capacity for organization and has lifted the Nebraska state show off the wilderness of the prairies and put it upon the map of poultrydom in America.

C. Bonsall, Fairbury, Neb., is the new secretary of the Nebraska association.

* * *

Improvement in Golden Wyandotte Type.

There has been a great change in the type of Golden Wyandottes. In 1900 the females had the length of Plymouth Rock females, not typical Wyandotte females. The males were frequently unsightly because of large, loose combs. The males also had too much length, their backs were too long, and their tails projected beyond their backs like the tails of Rhode Island Red males. In the summer of 1905 Theo. Hewes wrote: "The writer has found but few birds of this variety that filled the shape requirement, while many of our winning specimens would come nearer the Plymouth Rock description, quite a few of them even reaching the Java type, especially in females."

At the New York show of December, 1907, we saw for the first time a Golden Wyandotte cock that was a wonderfully modeled Wyandotte. There were no big

The Buffalo Incubator

Is Not Cheap

but it is

40% Lower in Price
than any other hatcher that can
claim standard construction

The Buffalo is made RIGHT—then
priced as low as a rightly built incubator can be sold. Sizes: 60, 120, 240, 360 eggs.

Chas. A. Cyphers

received from Mr. Foster D. Jameson of Friendship, Me.:

"This is only a small town of about seven hundred people, but I have sold twelve Buffalo Incubators and five Brooder Stoves; and every one of them is giving satisfaction."

Four counties in Northwestern Ohio produce several million eggs yearly for the large commercial hatcheries—the hens that lay the eggs are nearly all hatched in Buffalos. These breeders aren't guessing—THEY KNOW. Their neighbors see and know, too—so they buy Buffalos.

Here is another angle on the Buffalo—it pays for itself:

"Nescopeck, Penna., Feb. 11, 1921.
"You said I could pay for my No. 3 Buffalo by selling baby chicks. I sold enough to pay for it—and a great many more. Beside, I raised all the pullets I had room for. They were fine chicks; and began to lay at five months. Now I am going into the season with 150 pullets, am building a laying house 20 by 100, and I am ordering two Buffalo Brooder Stoves. I decided to buy Buffalo Brooders because the Buffalo Incubator is such a splendid machine."

"(REV.) J. H. YOUNG."

You can PAY for a Buffalo by selling a single hatch right from the machine—because the price is so low and the hatching percentage so high.

LAMP HOVERS—THE BUFFALO HANDY HOVER broods up to 200 chicks. It is clean, convenient and economical. It burns kerosene, and really is HANDY. The Lord Farms of Methuen, Mass., and others equally well-known, recommend the Handy to their baby chick customers.

"February 1, 1921.

"Last year I picked up three Handy Hovers, secondhand. They are all you claim—without doubt the best lamp hovers on the market today."

"FRANK M. HODGDON, Lexington, Mass."

COAL or GAS BROODERS—Government Experts and Successful Poultrymen everywhere pronounce the Buffalo BEST. The exclusive feature is the high drum, permitting the hover to be raised to varying heights from the floor for the accommodation of all sizes of chicks and of different weathers, WITHOUT SPILLING HEAT AT THE TOP. The auxiliary drum also keeps the room warm in cold weather. It's just the brooder you want for 300 or more chicks.

Mr. Lloyd M. Baker, Pottstown, Pa., writes: "The Buffalo Brooder Stove I bought last year is perfectly satisfactory. Send me a No. 2 Incubator." Mr. F. E. Locke, Livonia, N. Y., writes: "Please tell me the price of the Buffalo Brooder Stove this year—a friend wants one. Mine is four years old and I wouldn't sell it for twice what it cost unless I could get another just like it."

The Buffalo Never-Out Oil-Vapor Burner

The NEVER-OUT is heavy cast iron and has the weight of metal to perfectly vaporize the oil, whether kerosene or heavy distillate is used. It will never wear out—it doesn't warp out of shape, and burn yellow, smoking everything up—or worse.

The reservoir is large, so that it does not need to be filled every day. It is placed in a closed, dust-proof container, so that dirt can't work in and foul the valves.

The feed is automatic—but it is adjusted so that the oil cannot overrun the burner bowl and set fire to your building.

The feed pipe is large, so that molecular attraction does not hold the oil back, and then let go so that the raw oil splatters out in a burning spray.

The full flow is carried right to the regulator valve, which is placed beside the burner, where the oil is heated and kept at a uniform consistency. In the NEVER-OUT there is no congealed oil to clog the valves and leave your chicks without heat.

The regulation consists of a minimum flow or pilot adjustment; a height adjustment that keeps the oil from over-running; and an automatic thermostatic control.

combs, shallow breasts and long backs among the birds in that historic class. The first cock, shown by Charles H. Brundage, of Connecticut, had a tail that was short and bushy, and his breast was round. This cock again was first at New York in 1908, and again as a four-year-old at New York, 1909-1910. Since that time the true Wyandotte type has been more and more in evidence in the Golden variety both in the east and the west.

* * *

Giving the Judge a Bonus.

Are good poultry judges really appreciated by poultry show associations, or are they just re-employed the same as a bricklayer is again put on the job when a contractor has another house to build?

The Huntington (W. Va.) Poultry Association was so well pleased with the judging of Albert H. Emch at its recent January show that it paid him \$30 more than his contract called for.

It is not unusual for exhibitors to express their approval of a judge's work in words of praise, but it is very unusual for a poultry association to manifest its appreciation in so substantial a manner.

* * *

Status of Black Langshans.

If the classified ads in the Journal are a criterion by which the popularity of breeds may be judged, the Black Langshan is gaining rapidly in popularity.

In the February issue of last year there were 11 Black Langshan classified ads; in the February, 1921, issue, there were 24. That is an increase of over 100 percent, and no other variety shows an equal increase.

Anconas, S. C. White Leghorns and Barred Rocks also show material increases.

* * *

Death of Julius Bachmann.

Julius Bachmann, well known breeder of Silver Wyandottes, passed away at his home in Kansas City, late in January. Mr. Bachmann was 73 years old and had lived in Kansas City for forty-three years. Theo. Hewes, who knew him intimately writes: "I think you know Mr. Bachmann. He was for many years a prominent breeder of Silver Wyandottes, and one of the most lovable fellows that God ever put on earth."

* * *

Hewes to Manage Buffalo Show.

It was stated during the recent Indianapolis Poultry Show that Theo. Hewes is to conduct the annual poultry exhibition in Buffalo next year, and that the dates will follow Cincinnati.

Buffalo should be an international event drawing big entries from both Canada and the States; and Hewes has the experience and ability necessary to make The Buffalo Show a new and big attraction.

* * *

Profit by the Accumulated Experience and Wisdom of the Great Breeders.

If our principal purpose in writing "The American Breeds of Poultry" had been to make money for ourselves, we would feel that every time we referred to the book in these columns we were printing a free reader.

Our purpose, however, was to give to

breeders what we wish someone could have given to us years ago, and what we have had to learn little by little, here and there, from time to time.

We wanted to help those who are breeding the American varieties to fully understand their variety—to know what lies hidden in the pedigree as well as what is on parade.

If the book is to serve its purpose of making breeders more successful, it must have a wide distribution. It must fall into the hands of the many whom it is intended to help.

Many copies have already been sold, and although each goes out on the guarantee that if it is not satisfactory it can be returned, not one book has come back. Instead, we have received a number of splendid letters of commendation, including the following from the greatest breeder in America:

I have received copy of your new book entitled "The American Breeds of Poultry." I fully appreciate the rare information and instruction that the book contains. I congratulate you on so splendid a work in building a book of this character. I believe that it will be of great assistance to beginners in breeding, as well as to the older breeders of the varieties of Standardbred poultry that the book treats of.

The book shows deep research into the history of the different varieties and the processes that have been used by the breeders who have helped in bringing these varieties down to their present degree of perfection. I would strongly advise all breeders to read this book with the assurance that they will get great benefit by so doing.

E. B. Thompson.

* * *

That Great Cockerel.

M. L. Chapman has sold the 1st prize White Plymouth Rock cockerel at the recent Garden show to Starks Farm, Wisconsin, at a reported price of \$300.

* * *

The February Cover.

The male bird on our February cover was a reproduction of Arthur Schilling's famous picture of John Martin's crowing White Wyandotte cockerel.

* * *

Treat the Customers Right.

Harry Johnson says: "A square deal rounds out sales. It is to fair treatment of customers that credit for the success of a business must be attributed."

That is true in the purebred business as well as in the incubator business.

The growth of the poultry industry has made the present-day demand for purebred stock and poultry equipment. Those who are supplying this demand with a view to repeat orders as well as first sales are following the old-fashioned policy of a square deal to every customer.

* * *

Credit Due Mr. Wagers.

The instructive article which appeared on page 267 of the February issue of the Journal, entitled "Does Poultry Pay the City Dweller?" was written by W. H. Wagers, of Toledo, Ohio. Through an error the line of type on which his name had been set was omitted from the page.

Mr. Wagers is an attorney and belongs to that large group of professional men who breed Standardbred poultry for enjoyment and fresh eggs.

(Continued on page 328)

There's No Profit in Dead Chicks

and each one of yours that dies represents a waste of time and labor—and is practically the same as taking money right out of your pocket.

To RAISE chicks it is just as important to keep their living quarters light, clean and sanitary as it is to give them proper food. The presence of lice and mites, even if not in sufficient numbers to actually kill your chicks, which often is the case, means retarded growth and a weakened physical condition, that makes them easy prey for the many diseases that attack all poultry and especially young chicks.

CARBOLA
The Disinfecting White Paint

Instead of Whitewash and Disinfectants

is used with most satisfactory result—by thousands of poultry raisers in all parts of the country, and by many Agricultural Colleges and Experiment Stations to disinfect the incubators before the eggs are put in, for the brooders before turning in the young chicks, and to keep all poultry buildings light, clean, sweet-smelling, and free from the germs of contagious disease.

CARBOLA is a white paint and disinfectant combined, in powder form. It is ready to use just as soon as mixed with water and can be applied with a sprayer—it positively will not clog—or with a brush, to wood, brick, cement, stone, tar-paper, etc., and over whitewash. One gallon covers 200 square feet. CARBOLA will not blister, flake or peel. It is neither caustic nor poisonous—harmless to the smallest chick. The dry powder is unexcelled as a louse powder, and is much cheaper than other brands. Sprinkle it freely on the chicks, in the litter on the floor, in the nests and in the dust bath.

CARBOLA paints and disinfects at one operation—saves time, labor and money—makes it easier to do work that must be done. Your money back if you are not satisfied. Order it today and keep it on hand for a rainy day job.

Your hardware, paint, drug or seed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express.

10 lbs. (10 gals.) \$1.25 and postage. 20 lbs. (20 gals.) \$2.50 delivered. 50 lbs. (50 gals.) \$5.00 delivered.

Globe Incubators

Made by a practical poultryman

Globe Incubators are made to hatch, because early in our experience in operating a large poultry farm we recognized that an incubator which would give good hatches would be a great help. We found that a great many on the market were made to sell rather than to satisfy the purchaser. Our facilities for studying natural incubation were the most favorable for poultry raising was our only occupation. From these studies and the development of them we evolved

A PERFECT

Incubator & Brooder

Machines that were dependable, because self-regulating and automatic in the most vital operations. Machines that are not simply "good enough," but absolutely good. They have every necessary appliance, but not an unnecessary piece, and the prices are reasonable. They are machines to which you can trust the most expensive eggs and chicks without the least fear.

THOROBRED POULTRY

Shoemaker Poultry Farm is one of the largest breeders of Standardbred poultry in the world. We raise 48 different breeds and varieties of fowl. If you want breeders, order right away, as the supply is running low. Get our catalog, and place your order for hatching eggs now, thereby insuring delivery.

C. C. SHOEMAKER Box 605 Freeport, Ill.

Shoemaker's Poultry Almanac and Incubator Book for the Year 1921. 200 pages, illustrated with many colored plates of fowl. Tells about chickens, their cost, care, diseases and remedies. All about incubators, their prices and operation. How to get good hatches, etc. How to build poultry houses, etc. Only 20c. Money back if not satisfied.

H. M. Sheer Company, Quincy, Ills.
January 28th, 1921.

Gentlemen:-

I am pleased to advise that I have given the Metal Vaporizer, recently purchased from you, a most severe test and the results were conclusive that it was even more than what you claim for it. It will be of interest to you, I am sure, that I am now using your brooder heater for heating my garage and is working out in great shape.

Yours very truly,
W. W. Birnstock.

MCCELLIGOTT & CLIFFT
CARPENTERS

CAIRO, ILLINOIS

H. M. Sheer Co.,
Quincy,

Gentlemen:-

Please find enclosed \$1.00 for one 3 1/2 inch Metal Vaporizer for Reliable Brooder. I see the people's advertisement saying "Don't Be Humbugged by Metal Vaporizer." The one I got from you a few weeks ago makes me wish I had been humbugged last year.

Yours very truly,

John McElligott,
Cairo, Ill.

Proof Proof

Actual letters from users verifying that my All Metal Vaporizer does all and more than I claim—nothing equal to it

When I first announced to poultry raisers that I had perfected an All Metal Vaporizer that would overcome the common objection to asbestos ring vaporizers, namely: the tendency to become fouled with carbon—the emitting of gases, fumes and smoke—uneven flame, burner frequently going out entirely, I knew positively that it would do all I claimed for it because I had made exhaustive tests under all sorts of conditions to prove its merits.

Notwithstanding what some of my competitors may say, trying to discredit this Metal Vaporizer, the fact remains that it **does** and **is doing all and more than** I claim for it. I don't ask you to take my word for it. Here are a few of the many letters from my customers telling what it is doing for them:

"We have tried out your Metal Vaporizer furnished with your Sol Hot Blue Flame Wickless Colony Brooder Heaters and we find it all we can ask for, giving an even blue flame of intense heat and therefore prevents any accumulation of carbon whatever, thus maintaining an even flame continuously. Your improvements on these burners make them superior to anything we know of on the market."—Miller-Matlick Hatching Co.,
By E. C. Matlick.

"I am enclosing herewith my order for two more Metal Vaporizers. This shows you that I consider them a good thing or I would not place my order for two more."—L. A. Logner, Millstadt, Ill.

"I have tried out my new All Metal Vaporizer and find it all O.K. I will say this much—if I had to do without it, I would not use the blue flame brooder. I would go back to the lamp heated brooders, for while I used the asbestos ring, I had lots of trouble with my fire going out. But with the All Metal Vaporizer I can leave my brooder and never have to think of the fire going out or of chicks getting chilled."—J. E. Hallford, Columbia, S.C.

"I am writing to you in regard to your new Metal Vaporizer which I got a few weeks ago. I must say that it is very fine and beats the asbestos ring all to pieces."—John Collier, Kokomo, Ind.

"Your new Metal Vaporizer is all right. It is quite an improvement over the asbestos wick."—James Brower & Co., St. Louis, Mo.

"Your Metal Vaporizer is proving so satisfactory that I am enclosing herewith \$1 for another one for my second brooder."—S. N. Craig, Beaver, Penna.

"I am very well satisfied with your new All Metal Vaporizer. It is perfect. When I first saw it I wondered if it was worth the money, but when I saw the result, I said it is worth ten times the price. No more flame going out in the morning, no more fumes and oil gas, no more carbon. I am sure this new idea will

be helpful to every poultryman."—George E. Massey, Gems-Houdan Poultry Farm, Millville, Mass.

"I am very much pleased with my new All Metal Vaporizer. I only look at it once a week and it is always on the job."—Thomas F. Strauser, Port Trevorton, Penna.

"I have tried out your Metal Vaporizer and have found it very satisfactory. I am more than pleased and will use no more asbestos rings."—C. H. Sprouls, Hillcrest Poultry Farm, New Britain, Penna.

"I have tried out my new All Metal Vaporizer and find the heater worked much better than it did last year with the old style asbestos ring."—C. R. Weaver, Dillsburg, Penna.

"I have been using your Metal Vaporizer and am thoroughly satisfied with it. It is far superior to the old asbestos wick. It burns a very steady blue flame without the red flare that so frequently came up when using the asbestos wick."—N. G. Wulzen, Los Altos, Cal.

If you have been using asbestos ring vaporizers on your burners in the past, you know what a welcome relief it would be to be relieved of its objectionable features. My new All Metal Vaporizer will end your burner troubles—I guarantee it. Before anything better was invented to take its place, we had to be satisfied with the asbestos ring, but as every other modern labor saving invention has replaced the cumbersome "old time" methods, so also will my new All Metal Vaporizer, because of its superiority become more and more popular eventually replacing entirely the unsatisfactory asbestos ring vaporizer. Send me \$1.00, tell me

size and make of your burner and I'll send you one with the understanding that if you are not more than pleased with it—if it does not do all I claim for it—I'll refund your money. My All Metal Vaporizer is made to fit all sizes and makes of oil burners. It converts the Sol Hot oil burner into a gas burner. The flame responds instantly to any change of oil feed, so if you want the ideal equipment, the best that money can buy, you want a Sol Hot Burner, equipped with my new All Metal Vaporizer. Read my advertisement on next page then send for my free catalog folder telling all about the better Sol Hot equipment. (11)

H. M. SHEER CO., Dept. 26 , Quincy, Ill.

You Take No Risk

When You Select SOL HOT Heaters and Canopy Brooders

Dear Sirs—I like your brooder heater so well I want another one. Herewith please find enclosed remittance for which send Sol Hot brooder heater with vaporizing ring for 52" canopy.

Yours truly,
C. A. JORDAN,
Clemenceau, Ariz.

Less Trouble—Fewer Losses—Faster Growth

If you had spent your life doing one thing, studying and striving every day to do it better—working day and night to overcome every objection, isn't it natural to suppose you would be more successful than if you devoted your time to a dozen or more things? I have spent all my life inventing and perfecting poultry equipment, especially incubator and brooder heaters. It has been a life's

specialty with me. I know of no one who has done this in my line. The result is I have produced the most successful heaters and regulators on the market.

That's why I can say to you and say it POSITIVELY. You take no risk when you buy Sol Hot Heaters and Canopy Brooders. They are as near perfection as it is possible to make them. They require less attention—overcome the faults and discouraging troubles of other inefficient and impractical heaters. I have not space to describe the many decided advantages of my Sol Hot Heaters here. I can touch only on two important features—my new Automatic Oil Control and All Metal Vaporizer. See illustration at left.

2 of My New Recent Trouble Saving Improvements

These are outstanding features of Sol Hot Heaters. The Automatic flow of oil at the needle valve automatically controls the flame. Once you set the oil adjustment

by means of the adjustment screws, your flame will always remain the same increasing or decreasing automatically according to temperature variations.

Automatic Oil Control

All Metal Vaporizer

My all metal vaporizer completely eliminates the troubles caused by asbestos ring vaporizers. This vaporizer is guaranteed not to carbonize—will burn evenly all the time—will not smoke or emit fumes—will fit all makes of wickless oil burners. Sent postpaid for \$1.00

Read What Users Say About SOL HOT

William Guysman of Spencer, Mass. says, "Your Brooder is the best thing I ever used." P. M. Groves, Ellberry, Mo. writes, "Sol Hot Brooder is a chick's paradise." James P. Pound, Brookfield, Mo. says, "I have used seven of your Sol Hot Brooders, they are superior to any I have seen." J. Usher, Ontario, Can. says, "Am more than delighted with Sol Hot Brooder I got from you last year. It worked fine—couldn't be better." George E. Massey, Millville, Mass. writes, "I'm very well satisfied with your new ALL Metal Vaporizer. It is perfect and gives more value to your Brooder. No more flame going out in the morning—no more fumes or oil gas—no more carbon. It's worth ten times the cost. I am sure this will be helpful to every poultryman." Here's another from J. Collier, Kokomo, Indiana. He says, "Your new All Metal Vaporizer is fine. It beats the asbestos ring all to pieces."

And so it goes. Every mail brings unsolicited endorsements from users of Sol Hot equipment—poultrymen like yourself who have the same conditions that you have. That's why you too will be delighted with Sol Hot.

Write for Free Illustrated Folder Catalog

It will tell you all about Sol Hot Heaters and Canopy Brooders, why they are better and cheaper—why they insure better hatches—why your chicks grow faster and thrive better. These facts together with my low 1921 prices will be found in this free folder catalog. Don't fail to send for it. Don't make the mistake of buying any other equipment until you have investigated Sol Hot, the best and therefore the cheapest on the market. Write for free folder NOW—TODAY.

MILLER

READY-BUILT HEN HOUSES

MISSOURI FOOL PROOF HOUSE

All Built —Ready to Bolt

Get the distinction! Miller ready-built houses are more than ready cut. They come to you in sections completely built, all ready to bolt together. Everything included — hardware, roosts, nests, tables and roofing. Material clear yellow pine, tongue and grooved, double studded. Creosote stained and trimmings painted. Floors and partitions furnished if desired. Units may be added as your flock grows. May be taken down and rebuilt as often as required. If you move, take it along. Small units can be put up in an hour. More substantial than many permanent buildings. Any style house you want.

Missouri Fool-Proof Houses

So called because ventilation and light can't be neglected. Plan suggested by Missouri Experimental Station. Many poultrymen say it is the best ever built.

Other Fresh Air Houses

To the right is our popular semi-monitor roof design No. 251. A practical, sanitary house, giving an abundance of fresh air and light.

Write for Free Book

of Miller Ready-Built Hen Houses. Also say if you need a garage, bungalow, barn, hog house or other farm building. Write today. Let Miller's quantity buying, cutting and fitting save you time, money and trouble.

MILLER MANUFACTURING CO.

7959 Alabama Ave., St. Louis, Mo.

Mr. Wagers kept seventy White Leghorns in his open-front house (spoken of in his article of last month) during January. They laid from January 1 to 31, inclusive, ninety-eight dozen eggs of the value of \$78, and his feed bill for the entire month was but \$23.20. This shows that there is profit in chickens when properly taken care of. No effort was made to force egg production. He says:

"I could have produced several more dozen eggs if I had been anxious to do so, but fearing that I might interfere with fertility in my breeders I made no special effort to get high egg production. I attribute this success largely to electric lights. The lights are turned on in the morning when I get up and are turned on again in the evening when it gets dark and are left on until seven o'clock. Every evening when the weather is cold the fountains are refilled with warm water so that the fowls have a plentiful supply of warm water before they go to roost. Many make the mistake of allowing fountains to freeze up or to become filled up with ice so that the chickens have to drink ice water before going to roost. This is harmful."

* * *

Hens That Pay.

C. T. Patterson, formerly director of the Missouri Poultry Experiment Station and now operating a White Leghorn farm of his own, says:

The hen which lays 90 eggs in one year just pays for her feed. The hen which lays 91 eggs is one egg profit.

The hen which lays 290 eggs is 200 eggs profit and worth as much as 200 hens which lay 91 eggs each.

That is another way of saying that the hen that lays 100 eggs lays 10 profit eggs, and the hen that lays 110 eggs lays 20 profit eggs and is just twice as profitable as the 100-egg hen.

Mr. Patterson carries his argument a step further, adding:

If eggs for hatching from the 91-egg hen are worth three cents each the eggs from the 290-egg hen are worth \$6.

—which is not true, for there is no certainty that the 290-egg hen will produce 290-egg pullets.

More important than the individual record of the breeding female, are the strain that you buy into and the reputation of the breeder to produce prolific stock.

The Breeding Male.

Points to be considered in selecting the males: A good male bird must, above all things, possess an unlimited amount of health and vigor, and be from a high producing hen. These qualifications are best shown by early maturity. He is the first cockerel to crow—the boss of the flock. He should be of medium size, having a short and broad head, a bright red, full comb, and a full, prominent eye. His body should be deep, full and plump, with a well developed breast and fairly short, sturdy legs well set apart. He should have good breed type and in color be as near the Standard requirements as possible.

Egg Eating Hens.

Egg eating sometimes becomes a serious vice in a flock, the fowls becoming very fond of eggs when they have learned to eat them. The habit spreads from fowl to fowl and unless checked will often spread through the whole flock. Egg eating usually begins through accident by eggs being broken or frozen. See that the nests are properly supplied with straw or other nesting material and have them darkened, so that if an egg is accidentally broken the fowls will not be likely to discover it. Supply plenty of lime in the form of oyster shells, bone, or similar substances to insure a firm shell. As soon as it is discovered that a fowl has formed the habit, the fowl should be removed to prevent the spread of the vice. Once formed, it is difficult to eradicate, and the safest remedy is the death penalty, say poultry specialists of the United States Department of Agriculture.

Mr. Car-Owner

Save Money! Buy Dependable Double Tread Tires. Guaranteed for 6,000 Miles Service

Dependable Tires are constructed of the highest grade material and hardly ever blow out. Order today at these low prices.

Size	Tires	Tubes
30x3	\$5.50	\$1.60
30x3 1/2	6.50	1.75
31x3 1/2	6.75	1.85
32x3 1/2	7.00	2.00
31x4	8.00	2.25
32x4	8.25	2.40
33x4	8.50	2.50
34x4	8.75	2.60

Supremacy

A chicken is only good by comparison. It is only a remarkably good one until some one places a better one alongside of it. And it has come to be generally recognized that our birds are the better ones wherever we have shown them—at Madison Square Garden, Boston or New York State Fair.

At these great shows the past five years, our birds have proven that **Homestead Dominates** in the world of Campines.

This is significant when it is considered that each year the quality has been improved in

HOMESTEAD SILVER CAMPINES

Our birds produce more eggs per dollar invested in feed than any other breed on earth. Not only quantity, but great big meaty white shelled eggs, that make the poultryman happy.

The great winners at Madison Square Garden, Boston and New York State Fair are the connecting links of mating for the production of prize-winners and record layers. No birds are mated that have not the ability to lay in winter and summer and possess the Standard requirements that make them the most beautiful of all varieties.

Eggs for Hatching

Start right and your poultry keeping will prove fascinating and profitable. You cannot secure a better producing and money-making variety than Homestead "Vigorous Strain" of Silver Campines.

Eggs—One setting, \$10.00; two settings, \$17.50; extra choice selection, one setting, \$15.00; two settings, \$25.00.

Trios—\$35.00, \$50.00 and up.

Pens—\$50.00, \$75.00, \$100.00, \$125.00 per mating.

We also have a few single birds, both male and female, ranging in price from \$10 to \$50 and up

You Can Prevent Most Chick Losses

The too-frequent heavy death rate among chicks during the critical brooding period is one of the heaviest drains on poultry profits. Baby chicks are expensive—every one that dies is a real loss that can't be made up. It's better to raise the chicks *you have* than to replace them with others.

There is no reason why you should not grow to maturity practically every good chick you hatch or buy. The secret lies in feeding from the first meal the original "baby food for baby chicks"—

Pratts Buttermilk Baby Chick Food

It completely nourishes the chicks, resulting in quick, even, healthy growth and development; carries them safely over the dangerous first few weeks.

Chicks eat so little during the first six weeks that the slight extra cost of the perfect chick food—the original "Pratts"—is next to nothing. It is made up many times by the value of the *extra chicks saved*, and the *extra value* of every chick raised.

Let your chicks prove the truth of these statements. Feed them Pratts Buttermilk Baby Chick Food. If it doesn't please you—your money back.

Pratts Poultry Regulator

is needed by laying and breeding hens now, when they are laying heavily. Its tonic and invigorating effects help to overcome the strain of continuous laying and they lay eggs that are fertile and hatch husky chicks.

The genuine Pratts Poultry Regulator has been a big aid to successful poultry keepers for nearly fifty years. Why not test it? You are sure to benefit—you can't lose.

"Your Money Back If YOU Are Not Satisfied."

Refuse substitutes—get the genuine Pratts.
There's a Pratt dealer near you.

PRATT FOOD CO.

Makers of Pratts Animal Regulator, Cow Tonic, Hog Tonic, Dip and Disinfectant, Stock and Poultry Remedies.

BP-53

JUDGING THE PERFECT BIRD.

By FRANK H. DAVEY.

The writer's idea of a real chicken is a pullet that can win Madison Square Garden and go home and produce near the 300-egg mark within the year. This may be aiming rather high, but I believe it can be accomplished. There has been entirely too little attention paid to the utility side of our exhibition poultry, and the time is ripe for some utility clause to be introduced to govern the work of the judges.

How far would a fine Jersey, Guernsey or Holstein cow get in the show ring if she did not show a large capacity to digest large quantities of food, a large, broad udder, well developed mammary veins, and a thin soft skin? The hen is rather more complex, but why not take, to a certain extent, the same common sense view of exhibition poultry?

How far is it wise to go in this direction? We could at least make the penalty less for the defects that are usually caused by heavy egg production. A hen, if a heavy producer, seldom ever holds the rich yellow leg color of a pullet. A loafer always holds the leg color. Fading to a straw color could be allowed in hens, and some parts of the recognized Hogan test applied.

The loafer hen has only her body and feathering to take care of, and she usually provides for them exceedingly well. Her body is smooth and clean cut, her legs are rich yellow, and the plumage color about as good as when a pullet. The pelvis bones of such a hen are frequently short and stiff, locked close together and heavily covered with fat.

There are altogether too many hens of this class winning in the show room, and it is all wrong. I have in mind a Rhode Island Red hen that was nearly always in almost perfect plumage, with the color of an exhibition pullet. She was always ready for the show room, and has a long list of winnings to her credit, yet never laid enough eggs for a baby's breakfast.

Advertisers of exhibition poultry find among their customers more and more of a demand for high egg production, combined with utility qualities. We must combine the useful with the beautiful if we as fanciers are to hold our fundamental place in the poultry world, of being the improvers of our breeds of domesticated fowls.

How can we make the Standard disqualifications more uniformly understandable, or, to be blunt, how can we make them fool proof? In very many cases, especially among our younger judges and some of the older ones, if the white enamel of the earlobes of Mediterranean cockerels creep a little out from the lobe, the birds are disqualified. If the tail happens to be carried a trifle out of plumb, which happens nine times out of ten, when Mediterranean cockerels have been cooped too long, "out they go." If they have a pimple on the comb that is like a youth's mustache, the highly technical judge can feel it, but no one can see it—yet, disqualified again. So

"Premier" Egg Shipping Cases

Are ideal for shipping valuable eggs and have been used for years by thousands of poultrymen. Shipped direct to consumer from a mammoth factory and at remarkably low prices. 15 egg size, \$2.25 doz.; 30 egg, \$3.35; 50 egg, \$4.50; 100 egg, \$7.50.

PREMIER CHICK BOXES

TRANSPORT MILLIONS OF CHICKS each season with practically no losses. They are used by American Poultry School, U. S. Government Farms and the largest hatcheries. 25 chick size, \$1.75 dozen; 50 chick, \$2.70; 100 chick, \$3.80.

Western Box & Basket Co. Omaha, Nebr.

it goes with the whole list of disqualifications. If it is possible to make the Standard plainer it should be done, and if the disqualifying clauses cannot be worded more special, so all can understand, then a special article in the instructions to judges should call attention to such folly.

Mr. Judge, next time you are judging a class of birds, after you have taken each bird from the coop and examined it, try spending most of your time at the other side of the aisle, where you are seeing the bird three or four feet away, instead of fussing with your hand or stick in the coop, worrying the bird until it cannot possibly look as it really is. The next day, when you come around and find him standing in his natural position, you will not wonder why you did not place this bird. If you do not find this a good suggestion I will buy you a dinner; and do not forget to leave your judging stick home. A judge that pokes the birds around the coop, particularly those in the Mediterranean class, with their nervous temperament, ought to be shown the way to the door.

PRESENT-DAY BUFF ORPINGTONS.

By FRANK F. CONWAY.

I have been requested by the editor of the A. P. J. to pen an article on the present-day Buff Orpington, making reference to the progress that the variety has made during the past ten years. I have known Orpingtons and bred them for this length of time on this side of the Atlantic, and I bred them for a similar number of years in England.

I am glad to comply with this request, inasmuch as it affords me the opportunity to air my views on points that may be of interest to those who, like myself, are always eager to learn something new about his favorite breed.

We all know that the Buff Orpington was originated by the late William Cook of Orpington, England; that it is said he introduced the Old English Dorking as a frame builder, the Golden Hamburg for egg production and the Buff Cochins or the Lincolnshire Buffs (a breed familiar in Lincolnshire in the eighties) for color foundation. That is old history. But do you know, or have you stopped to consider, the vast improvements that have taken place since the first crosses were made to fit the breed so that it would so completely fill present-day requirements? A glance at the winning birds of today will show you that they are built on sound lines, to meet the requirements of both the fancier and utilitarian; or, in other words, they are a "commercialized exhibition fowl."

Feathering of the Orpington.

We need not go back more than five years to see the almost obliteration of the profusely feathered thigh, heavy stern fluff, the oval, cushiony, short coupled-up Cochins back. Such feathering and type is a menace to any breed where general usefulness is concerned. Of all the Orpingtons, I venture to say the Buff variety has advanced more steadily, because its breeders long ago took advantage of and adopted those modern and fundamental principles of type which are compatible with usefulness and productiveness. And is that not the reason why the Buff Orpington has

J.C. Bulis Manufacturing Co.

E. C. YOUNG CO., 6 Depot St., Randolph, Mass.

become the most popular variety of the Orpington breed, and aye, one of the most popular of all breeds?

The handsome Black variety was, a few years back, the worst offender. It closely resembled the Cochins in type, with the result that it lost considerable public favor as a layer and producer of fertile eggs. It is pleasing to note that this fine variety, through the guidance of its great breeders, is fast casting off its heavy garments and coming right into the fashion, which change is having the greatest beneficial results.

Correct Buff Color.

It will be remembered about nine years ago, there was much controversy over the buff color question. About that time I was asked by Mr. Denny to write a leading article for the Poultry World on this vexed subject of buff color. It seemed that certain of our judges and breeders were advocating the light colored buff, which color gave a washed-out appearance; and often one would see a decidedly mealy colored bird given preference over a bird of a darker shade of color at the shows. There were others, however, who catered to the dark red color of English importation, which went to the other extreme. The amateur or novice was certainly at a loss to know just what signified buff color. The Standard called for a golden buff, resembling a gold coin in color. I strongly advocated for the happy medium to strike this gold coin color, and pointed out the folly of continuing to

breed a lighter shade of buff from which one could hardly avoid getting a large percentage of off-colored flights, tails and undercolor, and mealiness on wing butts on females. I felt that a lemon color was not staple enough to hold out, as it is natural for a buff to breed and fade lighter.

Today golden buff color rules, and the extremely light color is seldom seen at any of our best shows, because our judges have conformed with the Standard requirements and breeders have been educated by their selections. When I mention "best shows," I mean such shows as Madison Square, Chicago Coliseum, Boston, etc., where all the cream of the breeders' birds are gathered under one of America's recognized Orpington judges.

Mating to Produce Buff Color.

In mating, to maintain this soft golden buff color, I always aim to match my breeding pens to resemble one color, both on the female and male side, if possible; that is, I match the breast, wing butt and shoulder feathers of the males to the color of the females. I choose hens that have molted through one season and have held up in color, and not gone shafty and patchy. I never use, unless it cannot possibly be helped, a male or female showing weakness in tail and flight feathers; and considerable attention is paid to soundness in undercolor throughout. I have always followed this system, which has always thrown a good percentage of

You Take NO RISK in Buying

Ironclad
THE IRON COVERED INCUBATOR

We Give 30 DAYS Trial

Because it is a tried, proven, guaranteed machine, and my special offer of an Ironclad Incubator and roomy Brooder for only \$19.75—freight prepaid east of the Rockies, is undoubtedly the greatest bargain Incubator offer of the season.

Made of California Redwood Covered with Galvanized Iron

Copper Tanks and Boilers

150-Egg Incubator—150-Chick Brooder

When an incubator is made of materials like this it gives you the strongest, most durable incubator that can be made

—a machine that will not warp or shrink, or open up at the seams, as every joint is lapped over with our galvanized iron covering—giving you a machine that will last a lifetime. Don't class this big, galvanized iron covered dependable hatcher with cheaply constructed machines. Ironclads are not covered with cheap thin metal and painted, like some do to cover up poor quality of material.

Ironclads are shipped in their natural color—you can see exactly what you are getting. Don't buy any incubator until you know what it is made of. Note these Ironclad specifications: Genuine California Redwood, triple walls, asbestos lining, galvanized iron covering. Galvanized iron legs, large egg tray, extra deep chick nursery—hot water top heat, copper tanks and boilers, self-regulator, Tyco's Thermometer, glass in door, complete book of directions, and many other special features fully explained in free catalog. Write for it today or order direct from this advertisement and save time.

Set up complete ready for use

MADE OF CALIFORNIA REDWOOD (8)

IRONCLAD INCUBATOR CO.,

BOX 31 RACINE, WIS.

even colored birds of each sex, as my wins at New York Madison Square, Chicago, Boston, etc., will testify.

Orpington Type.

Type, which signifies the breed to which the color belongs, is one of the most important considerations—broad, deep and well rounded bodies, showing clean cut lines, with tail of moderate length and possessing a natural spread to conform with the width of back, so that when you take a side view of the bird facing you, the shoulders, back and tail carry straight through without breaking, giving a gradual raise or concave from shoulder to tail.

The Standard says tails carried at 45 degrees of an angle. This does not mean that the angle should be taken from where the saddle commences to raise or center of back, as is sketched out in the White Orpington Club Book but from the root of the tail. The feather formation on the back, however, does lead up to and conform with the same angle as tail carriage.

It is, however, not always possible to select breeders to carry all these desired points, but whatever you do, avoid having the same weaknesses on both sides, or, in other words, should a male or female have a tail carried too high or show too pinched in tail, see that the opposite sex is particularly good in that section. If you find you have only three or four females of an ideal, to mate with a selected male, do not fill up the pen with other females that may not suit the set-up and style of the male. Make small matings that contain what fit together properly.

The most successful breeders of Orpingtons get their best cockerels and

pullets by breeding only three and four females to a male, especially when mating adult birds of two and three years old.

It is not always the person of long connection in the poultry business that is the most successful breeder; it is the fancier, who studies his birds, keeps records year in and year out for reference, taking time when mating up his pens, spending days instead of hours before he is satisfied in his own mind that the right females are headed by the right male, feeling convinced that the results from his careful selection will tend to result in improvement over his previous year's matings.

Neither is it always the winners that produce the winners, for a breeder may have a yard full of winners, but unless such winners are mated correctly, the percentage of good birds will be insignificant, nine times out of ten. I have stated the above for the benefit of those who may be purchasing stock or eggs for hatching, for the breeder's experience and abilities should be taken into account as being a part of the price paid for the purchase.

I will not make any reference here to feeding and rearing, etc., as this has been very thoroughly gone over in former issues of this Journal by Mr. Hubbard, but I will say this, that no matter how well you have mated your pens or how well you have brought your young stock to maturity, unless you shade your Buffs from the direct rays of the sun and protect them in time of rainy weather, all your endeavor will be wasted. If you desire to exhibit and make a win on them, shade them early, at least just before the adult feathers show through the chick plumage.

**A Straight Draught
Without Any Turns**

Cantleak Chimney Flange

Patent Applied For

can be set up on any roof and it will give you straight draught, from your fire up thru your chimney, and a straight draught without any turns is what you want to keep a fire going properly.

Lord Farms, the inventors and manufacturers of the Cantleak Chimney Flange, have been experimenting for a number of years and at last have found the way to obtain a straight and steady draught for the coal burning brooders and mammoth incubators, or wherever a fire is used in an out building.

No wire stays to support chimney—easy to slip it into place and it will stay there. Takes less than two minutes to set up and take down. Write today for one and forget your chimney troubles.

LISTEN TO THESE!

14 CHICKS OUT OF 15 EGGS

Received the eggs in good order, and out of 15 eggs I got 14 baby chicks—as pretty as they can be. Believe they are the best I ever saw.—T. M., Alabama.

RECEIVED 100 EGGS O. K.

Received the 100 eggs all O. K.—not one was broken. They were well selected, and packed better than any hatching eggs I ever bought before.—G. W. L., Missouri.

26 HUSKY CHICKS FROM 30 EGGS.

Regarding the shipment of 30 eggs, I wish to take this opportunity to thank you for the very generous treatment you gave me. I am pleased to state that 26 healthy chicks were hatched from those eggs, and that they are doing fine.—W. H. H., Manitoba.

RECEIVED IN PERFECT CONDITION

The shipment of hatching eggs ordered from you was received in perfect condition. Out of 34 eggs I hatched 13 nice, healthy chicks, which I must say is very good. They are growing nicely.—W. E., California.

DOING FINE, THANK YOU!

My order of eggs from you reached me O. K. and they are doing fine. I am more than pleased with results and very proud of my little Ancona chicks.—H. N. P., Colorado.

I HAVE HUNDREDS OF LETTERS LIKE THESE!

Nothing delights the heart of your true poultryman like a setting of eggs. He camps beside the incubator, one eye on the thermometer, and gives liberally of his time, labor and money.

And why?

All in the hope that the hatch will be good. It may be—there are infinite possibilities in an egg. The shell may house a record-breaking layer or a prize-capturing cock—or a weakly, nondescript bird that will never pay its way. Everything depends upon what is in—and behind—the eggs.

Back of every setting from

SHEPPARD'S "Famous" Anconas

is the strength and vitality of generations of thoroughbred stock. Back of every setting that goes out from Ancona Headquarters is the assurance that I am anxious to have you get the very best of results—that I will stay with you until you are satisfied.

I guarantee "Famous" eggs to run at least 75 percent fertile. My customers assure me that the percentage of fertility usually reaches 85 percent to 95 percent. In case your setting falls below 75 percent fertile, I will duplicate the entire order at one-half the regular price. I simply depend upon my customer's sense of fairness—and nothing less than his complete and absolute satisfaction contents me.

Orders for "Famous" eggs for hatching are already rolling in. They are being numbered as they arrive, and the early orders will receive the first attention. Don't wait too long!

Have You Missed Your Copy

of my latest Ancona catalog? We have been snowed under with inquiries for several months, but now we are ready to handle again the mailing of hundreds of additional books. Simply check the item in the coupon requesting this valuable book.

What then?

After your hatch has "come off"—ask yourself this question—has all my trouble been worth while?

Check up what you **hope** to obtain from other breeds with a positive performance like this!

"Famous" Ancona chicks will cling to life like fuzz to a pair of trousers. They mature early, and often before the fourth month will report for heavy and continuous duty with their first egg. After that they seem to get the egg habit and nothing can stop them. In a single year one Ancona rolled up the remarkable record of 331 eggs—a mark never officially equalled.

SHEPPARD'S "Famous" Anconas

also hold the world's record for flock egg production—265 eggs in 365 days. Cold weather holds no terrors for Anconas. Even when the wind howls 'round the hen-house and thermometer drops toward the bottom of the tube, Anconas keep right on hitting the high marks.

Wherever shown, "Famous" Anconas command favorable attention. Their alert, active appearance, their snappy, business-like bodies of a beautiful black mottled with white, their record as consistent year-round producers of large, white eggs—all these combine to make them unusual favorites, capable of capturing worth-while prizes at the Big Time Shows.

I would advise the early placing of your order. I will have more baby chicks than ever before this year—and they will go faster! Don't be too late!

Send Your Order Now!

—for eggs for hatching and baby chicks. Your order will be taken care of in rotation—it's a case of "First come—first served!" So get your order in early—right now—and be ahead of the crowd. Use the coupon to get my prices on "Famous" eggs and chicks!

AND TO THESE!

THE WAY THEY GROW! Best lot of chicks I have ever seen. They are vigorous, uniform, and they grow very fast. I could not duplicate these birds anywhere.—O. G., Indiana.

NO, NOT BAD—EVEN FOR THE "FAMOUS" STRAIN! One of the pullets from the chicks you sent me this spring laid an egg at the age of three months and twenty-seven days. Is this not pretty good even for the Sheppard "Famous" Anconas?—E. A. S., Indiana.

SOMETHING WRONG THE SECOND DAY! One of the pullets you sent me laid her first egg on the day she was four months old. She skipped the second day and has laid an egg ever since.—S.N.W., New York.

EAT ABOUT HALF AS MUCH AS OTHER BREEDS! I want to get rid of my other chickens and keep the Anconas only, as I like them in every way. My other chickens eat about twice as much as the Anconas and they are harder to look after.—L. M. C., Ohio.

Singing in the Cold Blizzards! It has been very cold here all winter—from zero to 40 degrees below—but the Anconas kept right on laying and singing in these cold blizzards.—C. M. M., New Hampshire.

Don't let this line separate you from "famous" eggs and chicks

HATCHABLE EGGS AND VIGOROUS CHICKS.

By OTTO E. HACKMAN.

One of the most frequent difficulties the beginner in poultry raising experiences is in securing a high percent of hatchable eggs; eggs that will produce vigorous, robust chicks—the kind that will live and grow every day from the time they emerge from the shell till maturity has been reached. Anyone can hatch some of the eggs and raise some of the chicks, but not every one puts their breeding stock in the condition necessary for the production of fertile eggs that will hatch chicks of good vitality. Certain it is that upon the condition of

the breeding stock depends much of our success in hatching and rearing. Breeding stock of low vitality or that is improperly mated cannot produce the results we desire. A little extra time given to the selection of the birds used in the breeding pens will be time well spent. We can all afford to do this, and should do it if we expect to be rewarded with success.

A high percent of hatchable eggs cannot be obtained if too many females are used in the breeding pen. Only as many females as can be properly served without taxing the reproductive powers of the male bird should be put in the pen. Close observation in this regard will aid in deciding the number of fe-

males to use. Birds of the heavier varieties require fewer number of females in the pen than is the case in the lighter, more active breeds. A male bird of a medium sized breed will properly care for ten or twelve females, while a lighter and more active bird, such as the Leghorn, will do well with as many as fifteen females.

Careful selection of the hatching eggs is absolutely necessary if we are to expect good hatches. Haphazard selection of the eggs with no regard for their age or condition is not conducive to best results. I would not advise the use for hatching purposes of eggs that are more than two weeks old at the most, unless absolutely necessary. While

Hatch and Raise Every chick!

Don't Take Chances—Eggs wasted in the incubator and dead chicks under the brooder costs you money! My new 100-page book will show you how to avoid this loss. It will show you successful methods I have used during 30 years of poultry farming. Know how! You, too, can make poultry pay big money the year 'round by using my secrets and practical methods.—Prof. T. E. Quisenberry.

Don't Wonder! Don't Guess! Start right! Today! Every chick hatched means more money this year than ever before. 1921 will be the big profit year for poultry raisers who know the secrets of hatching, brooding, feeding and bigger egg yields. This free book makes your success certain.

My Big Free Book Tells You Hundreds of Secrets to Make You Money

- How to get fertile and hatchable eggs.
- How to prevent dead chicks in shell.
- How to prevent bowel trouble and white diarrhea.
- How to keep chicks vigorous, healthy and growing.
- How to get the highest market prices.
- How to cull out slackers and poor layers.
- How to get more eggs with less feed.
- and hundreds of other valuable secrets you can't afford to be without.

SEND NO MONEY! This Book is Free to prove what I say if you will write me at once, before all copies are gone. Just write me a short letter or a post card will do, and the book will come postpaid without any obligation on your part.

T. E. Quisenberry, AMERICAN POULTRY SCHOOL
Desk 2067 Kansas City, Mo.

Raised 497 Out of 500 Chicks

I had 500 chicks in my back yard plant. I followed your advice on feeding and raised 497. I truthfully can say the Quisenberry way makes every hen pay. Harry S. Mark, Pennsylvania.

School Girl Clears, \$1,592.65

After following your advice I made from less than 500 hens a clear profit above feed, etc., of \$1592.65 in 9 months. Virginia Kober, Mo.

Prevented Chick Loss

In 1919 we lost 650 out of 1500 chicks. We followed your advice in 1920 and only lost 65 out of 1000 chicks. Geo. M. Jones, California.

Values It at \$1,000.00

I would not part with the information you have given me on feeding and baby chicks for \$1,000. It has saved me that much this past two years. A. J. Bailey, Nebr.

Cured White Diarrhea in Flock

Last spring white diarrhea started in my 1500 chicks. They died like flies. Your advice reached me just in time after losing 500 in one week. I began following your methods, finally raising over 1100 vigorous fowls. A. E. Anderson, Nebraska.

Double the Egg Yield Save 1/3 on Feed

DES MOINES INCUBATOR CO., 1 Second St., Des Moines, Iowa

28 years of big successes prove that the "Successful" is the incubator you want to insure your success this year. Write for my 1921 offer.

they may give a creditable hatch, of course, we cannot expect them to bring forth chicks possessing an abundance of vitality. An egg that is fresh will hatch several hours earlier and produce more vigorous, livable chicks than one that has been laid a week or more. The eggs should be culled and only the best used, for the culling of the hatching eggs is as essential as culling of stock. Too often the eggs are taken as gathered, with no regard for size or condition. Eggs showing imperfections or irregularities in the shell should not be used for hatching. Such should be discarded and used in the kitchen or for market purposes. Some eggs, too, are too thin shelled to use for hatching and should also be discarded. These are usually so porous that they permit of too rapid evaporation of the moisture content. The tester should be used on all eggs before setting and those with imperfections should at once be discarded.

Some consider the feeding of the

breeding stock as having no bearing on the fertility or hatchability of the eggs, but in reality this is just as important as feeding the laying stock for an increased egg yield. Hasn't it been noticed that in the spring of the year, when the breeding stock has the run of the range, that fertility will invariably average high? Everything is favorable for high fertility. Animal life, green food, etc., can be had in abundance and contributes to the getting of good hatches. Then, why not, insofar as possible, supply the same conditions earlier in the season when the fowls are still confined indoors? Animal food in the form of meat scraps, green cut bone, etc., can be supplied, and green feed can be provided in the form of sprouted oats, cabbage, mangels, etc. This with good wholesome food, fresh, clean water, and plenty of exercise, backed by healthy, vigorous breeding stock, will assure us the results we long for. We should avoid as far as possible the use of pepper or strong stimulants in the ra-

tions of the breeding birds, as it undoubtedly affects fertility. It is not our aim to force the breeders for eggs, but to keep them in maximum vigor. Ground mustard, however, seems to have no ill effect on the breeding birds. In fact I believe it aids in securing good fertility. I refer to the kind of mustard prepared purposely for poultry.

One of the many questions that is usually asked by the amateur poultry raiser is "how long will it take to secure hatchable eggs after the male bird has been placed in the pen?" One can usually expect a high percent of fertile eggs after the male bird has been with the hens ten days or two weeks. Some eggs will be fertilized after the male bird has been in the pen only a few days, but good results of course cannot be obtained until after about two weeks.

Eggs for hatching must be handled carefully during the cold spring months to prevent the germ from being weakened or killed by cold. On cold days the eggs should be gathered every three or four hours to prevent chilling in the nest.

Again—for the Ninth Time MY SILVER CAMPINES ARE CHAMPIONS

At the Coliseum, Chicago, Dec. 1 to 6, 1920, I Won

Cocks	Hens	Cockerels	Pullets	Old Pen	Young Pen
1	1	1	1	1	1
2	2	2	3
..	..	5	4

I have had 62 males placed under ribbons at the Coliseum Show in last nine years. During the same period, I have had 147 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

I have the largest plant devoted to the raising of exhibition and high egg record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous.

PROPER MATINGS IN LIGHT BRAHMAS.

By O. L. PUTMAN.

With the increased number of people taking up the breeding of Light Brahmas, I am receiving a great many requests for information in regard to mating Brahmas to produce birds excellent in Standard requirements.

It has been my experience that probably 40 percent of the success in producing high quality show stock depends on the development. Parent stock may be of the best, and properly mated, but if the youngsters are allowed to drag at their development, or receive a slight setback, inferior and undersized stock will be the result.

A bird may be out of condition for only a few days during the growing season and it will be reflected in perhaps one or more of the primary feathers of the wings, which will show a grayish tinge. Overcrowding, I believe, also produces this result. I would not consider this a serious breeding defect, for such a bird may come through the molt without showing a trace of this gray.

For the benefit of those who are just starting with Brahmas, I would say that my ideal mating is hens from one to three years of age, Standard in all color sections, showing a very dark color; but here care should be exercised to see that there is no outcropping of black or gray in the web of feathers in the back, also as little black as possible showing in the web of cape feathers between the shoulders at the base of the hackle. I prefer a rather wide hackle feather.

The under color on wing bows and breast usually will be, and I believe should be, somewhat lighter than that at the back. This same would apply to fluff. While the slate in the under color of the fluff may extend nearer to the surface and show more or less smoke cast, I would prefer the hens to be as white as possible in this section.

I do not think it wise to demand too much in the way of coloring in leg and toe feathering. While these parts should be well feathered, there is danger of developing vulture-hocks by trying for too heavy a feathering here.

The tail should be carried rather low and well rounded, thereby giving a broad appearance to the back. The tail coverts should show a great density of black, with a white edging perhaps one-eighth to one-quarter inch wide.

If such hens are well balanced in shape and carry a weight of 8½ to 9½ pounds when in breeding condition, they are almost ideal.

For such hens I would select, preferably, a yearling cock; or would not object to a cockerel if he were sufficiently mature.

I do not care for an overly large male bird, as poor fertility frequently results from breeding a big, coarse, fat male; and I believe size and shape in the progeny are more influenced by the dam, anyway.

As we have considerable density of under color in our females, we will require less in the male bird. This bird, I believe, should show rather a narrow ledge of slate under color through the back, somewhat increased as it approaches the saddle hangers. I consider of great importance the saddle hangers. They should be of very distinct black and white with white predominating,

GIES' ANCONAS

World's Best Layers By Test

sas City or Racine

No work. No worries. No crowding. No fumes. No hot or cold spots.

Electric heat in your brooder does away with all filling of lamps, trimming wicks, shoveling coal or carrying out ashes.

There are no fumes, no smoke. Your chicks breathe fresh, pure air all the time.

And it is so easy, so simple for you. Connect the Lectro-hatch Brooder to any electric light socket and turn an adjusting nut until the thermometer shows just the temperature you want. Then your worries are over.

Night or day, the temperature in your brooder never changes, but holds steady and even, right where you set it. That means no ups and downs in temperature—no frozen or roasted chicks.

What's more, the heat is uniform in all parts of the brooder. There are no hot spots and no cold spots. Chicks don't have to crowd together and trample each other to keep warm.

Big, Strong Chicks

Pure air, unchanging heat, and no crowding will prevent a big part of your usual chick losses. And every chick will be healthier and will develop more rapidly. You will have more and better fowls.

Costs no more than burning oil, and usually less. For instance, with cur-

rent at 5c per K. W. hour, our big 500-chick brooder costs only about \$1.50 per month to run; and our 150-chick brooder about \$1 per month. Operates from any electric current—from farm lighting plant, traction line or town lighting system.

Strongly built of galvanized iron, with wool felt curtain. 500-chick size, \$30; 150-chick size, \$20. Order from this, or write for any information desired. When ordering, tell us the voltage of your electric current.

Hatch With Electricity In Your Old Incubator

The same advantages of pure air and steady, even heat without worry or watching, can be had in your oil or coal incubator, at modest cost. Our Lectro-hatch Electric Hatching Element is easily installed in old incubators. We also make complete new Lectro-hatch Incubators. Every week, hundreds are adopting electric hatching. Write for full information.

Electric Controller Co.
410 E. 10th St., Indianapolis, Ind.

and as the saddle approaches the tail the saddle feathers should show the V-shape black lacing in profusion. This V-shaped black striping may extend well up onto the back as long as there is a good break, that is, a clear white space between the black tickings and the under color. Where the black of the saddle stripe extends through, or blends with the under color, black in the backs of female progeny is sure to result.

I know that any breeder who is able to mate together such birds as I have described will have no difficulty in producing 90 percent or better of high quality show stock, provided such birds have themselves come from stock that has been linebred for a sufficient length of time to represent a true breeding strain. Of course, regardless of the strain, some birds will be more recessive in their ability to produce their like than are others.

Perhaps I have not laid stress enough on the fact that constitutional vigor is the one prime factor in all lines of breeding.

When You Do Not Have the Best.

Now, the mere fact that all birds do not come up to this high ideal is no reason why good results may not be obtained from birds possessing less individual merit. It is not uncommon to find unusually good females or males with some weak points. For instance, we may have females showing a flash of white in wings, with too broad a white edging on hackle. This may, in a measure, be overcome by selecting a male bird exceptionally strong in these points. For such females, especially if they are somewhat lacking in under color, I would select, if possible, a male bird showing little or no white edging on wing primaries. He should be a bird with an abundance of under color and saddle ticking extending well up over back, being careful to see that he did not show any white or gray at base of tail feathers.

Now, regarding those difficulties that the beginner is most apt to encounter in producing high quality stock: The Standard defines but two colors for Light Brahmas, black and white. Occasionally a bird is seen with some feathers showing a buff or brown cast. This, to my mind, is one of the greatest defects and should be guarded against above all others.

While there are a few birds showing this tendency, we find a great many with a tendency to gray. What we are striving for is a silvery white with the black so clearly defined that it not only has no tendency toward gray, but shows a green sheen on all sickle feathers of the male.

As before stated, vulture-hocks may occur from trying to produce an over-abundance of toe feathering. There is also danger of birds being too scantily feathered, in some cases showing almost a bare middle toe.

Flash in the wing of females is very objectionable in high class show specimens, but by using plenty of color in male birds this defect is readily overcome. I would, therefore, not condemn a female as having a major defect because she showed flash in wing.

To get true Brahma type we must have a long-bodied bird. Short backs in breeding stock should be guarded against.

The comb is influenced by the male bird more than the female; therefore it

is well to use as good a comb as possible on the male side. The wattles should be of medium size on males and rather small on females. Females should have a well defined dewlap, that is, a pendulous development under throat, between wattles.

Little trouble in this respect will be found where hens or pullets are up to Standard weight. The Standard weights for Light Brahmas are: cock, 12 pounds; hen, 9½ pounds; cockerel, 10 pounds; pullet, 8 pounds.

I before stated that I liked hens 8½ to 9½ pounds when in breeding condition. These same birds in show condition would carry a weight of one or two pounds more, and it is not infrequently found that Light Brahma hens when overfat weigh 13 or 14 pounds. I also cautioned against using too large male birds on account of poor fertility. I do not like to use a cock bird under 10 pounds when in breeding condition, neither do I like to use a cockerel much lighter than this. I would also object to a male bird over 12½ pounds in weight, as a breeder.

Many breeders have trouble keeping male birds in good condition during the breeding season. Especially is this true where birds are closely penned.

I have found a very satisfactory way to overcome this difficulty by placing a small tin drinking cup on the wall of the house so that the male bird can eat from the cup, but it is placed high enough to be out of reach of the females; and if kept well filled with feed it will be found to keep breeding males in much better condition where they have a tendency to lose flesh.

There might be much more said relative to the mating of Brahmas, but I hope the foregoing may be of benefit to numerous beginners who have recently taken up this grand old breed. I would suggest to those interested in Brahmas that they become members of the American Light Brahma Club.

Mating Time Is Here.

At hand is the time when the matings must be made for the present breeding season. Nothing of greater importance confronts the breeder during the entire year. Once the mating is settled, the die is cast for the coming year and the success or failure of the mating will depend upon how wisely the birds have been selected. This is the opportunity for the breeder to exercise all the art, all the craft, all the fund of breeding information which he has acquired as the result of years of experience in selecting for the different matings the birds which are best suited to go with one another and to produce quality in the year's young stock.

Proper incubation, successful brooding and good management of the growing stock are of course essential in raising good chickens, but with all these and without the birds being mated to the best advantage the best quality will not be obtained.

In making the matings it will therefore pay the breeder well to spend a considerable amount of time in studying and selecting the individual birds. Compare the different birds available, weigh their strong points and their weak points, and keep in mind the particular purpose of each mating.

H. M. Lamont.

Brood Your Chicks

30 Days FREE

Simplex Brooder Stove

Use the new 1921 Simplex Brooder Stove on your own hatch for thirty days free. Raise 20 to 50 per cent more chicks at 1-5 the cost, 1-10 the work and 1-4 the operating expense. Small and large broods. Three sizes of stoves. Try our stove under all conditions and if you are not delighted send it back and we will cheerfully refund your money.

Turn Losses Into Profits

This wonderful brooder will raise 50 per cent more of your chicks than you have been able to raise under the old fashion methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by the extra money it makes for you. The Simplex Brooder Stove burns kerosene oil, natural or manufactured gas, automatically regulated to insure an even temperature with the least possible attention.

Free Brooder Book

Write today for valuable free brooder book and catalog. It tells how to "increase your profits by decreasing mortality." Tells how to save chicks you have been losing each year through disease and faulty brooding. How to make more money. Also catalog and details of 30 days trial free. No obligations. Write now.

Articles should be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

INCUBATOR CHICKS IN STOVE BROODERS.

First Prize Article.

Moving to Virginia from the West last February, we desired to get a fair sized flock of pullets for the Fall egg trade; but as we had no stock to hatch from we visited several hatcheries, and found the first one swamped with orders for several months ahead; the second one had several open dates for the latter part of April, and this being about the time we desired to get Leghorn chicks we made a deposit to hold that date for us.

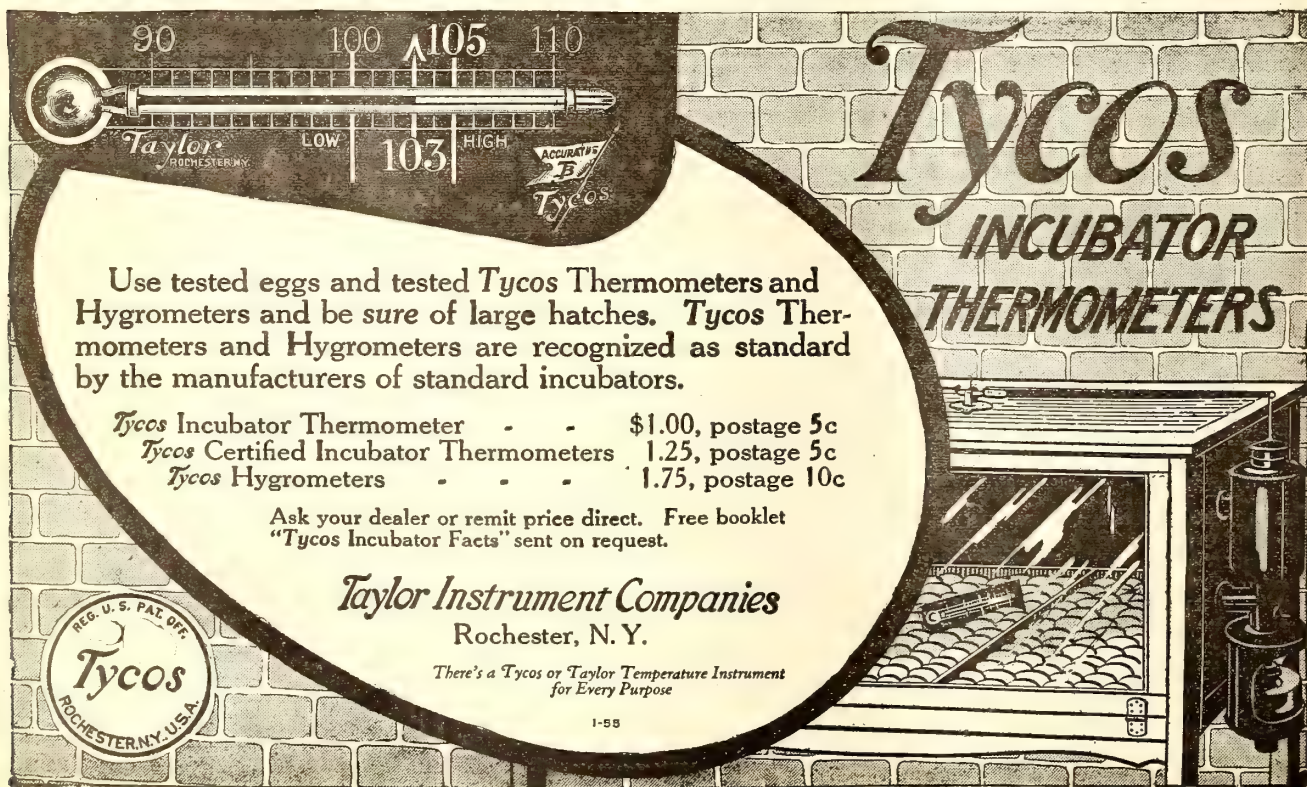

We moved on a small place of eleven acres. There were two poultry houses on the place, and either one could be very conveniently arranged for a colony brooder stove. I purchased one of the stoves and after thoroughly cleaning and spraying the house and filling in several inches of fresh earth and sand, the stove was erected at about the center of one-half of the building, a canvas partition having been erected through the center of the house, to within six inches of the floor, so as to provide a cool room in which the chicks could exercise when feeding and thus harden off. The other part of the room, containing the stove, was used as their sleeping quarters.

The time came that I got the call to go after the chicks. The stove had been operating nicely for the previous

two days. My order was for 350 chicks for April 20 delivery and 350 for a later date. In this way I thought I would save buying the second stove, but as I arrived at the hatchery and was about to pay the assistant for 350, he stated that he had the 700 all ready and in the boxes as it was his understanding that I wished them all at one time if possible. As the proprietor was away there seemed no way for me to get out of taking the 700 so I paid for them and as I drove away I studied seriously as to my best way out. There was another house but it was in no shape to receive baby chicks. I fully realized that a "chilled chick" is a "dead chick." I located another brooder stove and took it out with me. It was about dark when I arrived home and I placed 400 of the chicks around the stove that I had working and kept the other 300 in the boxes at a carefully watched temperature.

The same evening I cleaned and sprayed the other house and set up the stove and put it into operation, kept it going that night and the next day, and as it was going so nicely by the next evening, I placed the chicks that were left in the boxes around this stove.

Both house floors had litter of clover hay spread over them and the first thing offered the chicks was a drink of sour milk. After they were 48 hours old, they were given a light

HAROLD TOMPKINS'

SINGLE AND ROSE COMBS

RHODE ISLAND REDS

STANDARD AND UTILITY BIRDS

Oldest Line Bred Flock in the World

More than a half century ago my grandfather started linebreeding Rhode Island Reds to produce birds with long, deep bodies and an even shade of red, that would lay large brown winter eggs. He thus established the characteristics that have made this breed the greatest business fowl of the world and laid the foundation of the famous TOMPKIN'S STRAIN.

Leading Rhode Island Reds of the World

The records of my birds in the show room throughout this country for years furnish absolute proof that they stand supreme. This season they again demonstrated their superiority by their phenomenal winnings at the two leading Rhode Island Red meets of the country.

Boston, December, 1920; January, 1921.

Grand Matings for Hatching Eggs in 1921

These matings contain some of the best specimens of Rhode Island Reds in existence today. Not only do they include my famous winners at Boston, Rochester, Madison Square Garden and Kansas City, but the breeders that produced these winners.

The winnings of my customers the past year in all of the leading shows throughout this and foreign countries prove that TOMPKINS' RHODE ISLAND REDS lead in the production of show birds. The easiest way to get this blood and to produce winners for next season's shows is to buy hatching eggs. Send for mating list and place your order at once.

Choice Breeding Birds

The true Rhode Island Red type and color has been so strongly fixed in the blood of these birds by years of systematic breeding that they are unexcelled for new blood or foundation stock. Plenty of nice, well matured birds to select from that will fit any breeding pen.

Headquarters for Everything in Rhode Island Reds

If you intend to buy Rhode Island Reds you will save time and money if you will come to headquarters. You are assured of complete satisfaction in all dealings with me. Write your wants to

feed of two-thirds rolled oats and one-third wheat bran, to which a small amount of charcoal was added. This was fed on papers, and as I tapped on the papers they soon learned the trick of eating. After the feed the papers were removed.

The above feed was given five times daily in small quantities, and at the time of the first feed each day they were also given some clean sand in limited amount. After about ten days the feed was placed in hoppers.

After the chicks had learned to eat for several days we began to add a little commercial chick feed to the oats and bran and gradually increased this until in another week I had them changed to the oatmeal and bran at morning, noon and night, and the two feeds between meals were of the commercial chick feed thrown into the litter so as to get them to exercise. They soon learn to scratch and you could almost see the husky little fellows growing. They also had all the sour milk or buttermilk that they would drink, and the milk, feed and water pans were frequently scalded to avoid disease. After the chicks were three weeks old, a mash consisting of equal parts of bran, shorts, cornmeal and oatmeal with a small amount of bone meal and charcoal added, also one-half pound of salt to 100 pounds of mash added. This mash was placed before them in hoppers. The scratch feed from now on consisted of equal parts of cracked corn and wheat in litter, all they would clean up in thirty minutes, twice daily. Very little meat scrap was fed in their mash, owing to the fact that they had sour milk and got the necessary animal protein in the milk.

When the weather would permit them to be out, they had the range of a cornfield and pasture.

In less than six weeks some of the cockerels were crowing and a good number of them were marketed at less than eight weeks. The remaining cockerels were marketed at ten weeks. This gave the pullets more room and as a very small percent of the chicks were lost, they needed the room. The chicks averaged a trifle over 50 percent cockerels, and after the cockerels were marketed and the pullets had been severely culled, and all that lacked vigor and Standard disqualifications were sent to the market there were left, as healthy vigorous layers, 259 pullets. At five months of age they began to shell out the chalk white eggs.

My experience with these chicks teaches that successful brooding depends on attention to small details. First the chicks should come from unforced, healthy, vigorous stock that is well matured. Special attention should be given to providing plenty of heat in the brooder, constant, regular heat, and pure food and sanitary conditions.

Virginia.

F. M. Shank.

Keeping eggs in a room warmed during the day time and cooled off at night is injurious to hatches because the day time heat starts germ growth in the eggs and the chilling at night kills the developing embryo. Much of the complaint of poor fertility in early hatches is due to the germs being killed by allowing the eggs to chill.

ARTHUR G. DUSTON, Supt.

A WOMAN'S MODEST SUCCESS.

Second Prize Article.

I have been thinking that perhaps the readers of the American Poultry Journal might be interested in the way one woman makes a fair income.

To commence with I should like to say that we live in the suburbs of a small city, near the end of a short street that comes to an end in a swamp.

We have three acres of low and poorly drained land. We are not connected with sewer or city water.

It is hard getting our work done in the spring because it is so wet and the hot days of summer dry our soil badly.

In spite of these handicaps I have worked up a fair trade in flowers and poultry. And let me say right here they make a splendid combination, if they are kept separate.

Last year I commenced the new year with 37 hens and pullets and 6 ducks. We took good care of our poultry. Had lights in the hen house, litter for the hens to work in, dry mash, green food and plenty of water and I got eggs all winter.

I sold my eggs to private customers and received the highest market price. My eggs were always clean and fresh. I put them a dozen in a box; white eggs in one box and brown eggs in another. And my customers were pleased with them.

I bought three incubators and a trio of turkeys.

In April I commenced advertising my gladiolus bulbs and sold more than I wished to spare. As soon as we could get the seed in, we planted cabbage, cauliflower and turnip seeds in the open ground and aster seeds in a cold frame.

In May and June I sold a great many plants. Would have sold more but expecting a wet season as usual we put our plants on the worst piece we had for drying out. The culled plants were fed to poultry.

Before the plants were gone I was selling flowers such as peonies, sweet William, larkspur, etc., later sweet peas, gladioli and asters.

As soon as my chickens were large enough I commenced selling broilers, and of course more eggs as soon as I could put away incubators. I had at least one order for chickens in August, which I could not fill.

I went from house to house in the more wealthy portion of the city taking orders and delivered when they wanted them.

It was one of the hardest things I ever had to do at first but I soon had a fine lot of customers. Instead of a dread it was a pleasure to take orders.

I weighed my broilers after bleeding and removing feathers, then finished dressing ready to cook. My customers were pleased with them. They were so much better dressed and nicer in every way than those at the butcher shop.

I could not supply the demand and bought some to dress off.

My customers also wanted geese, ducks and turkeys. I think another year I can work in garden truck.

Stop Hatching Weak Chicks

With Cheap Incubators

Remember, it is not how many you hatch that counts, but how many you raise. Chicks that hatch out weak and wobbly, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Chicks That Live and Grow

The Queen is accurately regulated—taking care of a temperature variation of 70 degrees without danger. It is built of genuine California Redwood—very scarce in these days of imitation and cheap substitution. Redwood does not absorb the odor from the hatching eggs. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors, to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is cheap in the long run. It will be turning out high percentage hatchings years after the cheap machines have been junked. Sold by dealers. Catalog sent free on request.

WHY FEED CRYE-CO.

99% PURE CARBONATE OF LIME.

TEN REASONS

1. BECAUSE it increases the egg yield considerably, therefore **Your Profits.**
2. BECAUSE it contains **99% Pure Carbonate of Lime** which makes the shells—hard shells which means less loss in shipping.
3. BECAUSE it contains pure silicate grit, giving the hen finer plumage, and being cubical in form a perfect grinder, thereby insuring digestion of the food.
4. BECAUSE in Crye-co you have a perfect shell producer and grit combined, far superior to oyster shells and ordinary grit.
5. BECAUSE it means economy, as Crye-co goes half as far again as shells, as there is no waste, and you need no additional grit.
6. BECAUSE it promotes digestion, keeping the hens healthy, and in a great measure prevents egg eating.
7. BECAUSE it costs no more than ordinary shell or grit.
8. BECAUSE it has the hearty endorsement of many of the most prominent fanciers and poultry raisers in the U. S. Men who know. (Original letters on file.)
9. BECAUSE you are raising chickens for the results and not for the pleasure out of seeing them around or the work there is in it.
10. BECAUSE as a wide-awake poultry raiser you want better results and in Crye-co you will find them. Let us prove it to you.

Therefore buy a sack from your dealer today, but **LOOK** for the **TRADE MARK** in a white sack or write us for **FREE SAMPLE** and booklet.

FOR QUANTITY PRODUCTION AS WELL AS FOR SMALL LOTS OF CHICKS.

NATURALLY enough a great many people have concluded that on account of the Putnam Homemade Brooder (equipped with the \$4.75 complete Putnam Brooder Heater, which is sent postpaid to any address), being rated at twenty-five to sixty chicks, its use is limited to the brooding of small numbers of chicks, perhaps two or three hundred—but this is not the case! For example, please read the following recent letter from a customer who plans to raise 1,800 chicks this season, with their help:

"Oscawana-on-Hudson, N. Y.,
Feb. 1, 1921.

"Mr. I. Putnam, Elmira, N. Y.

"Please ship me at once two complete Putnam Brooder Heaters, one dozen wire wick holders and six dozen wicks for same.

"If you will refer to your books you will see that you sold us ten of these Putnam Brooder Heaters three years ago. Used them one season and then for large production decided to adopt the — Colony Coal Burner, but have come to the conclusion that your method is the most practical.

"Am now going to run twelve of them at once, and when the chicks are six weeks old, put them with the — Colony Brooder in three or four hundred lots. In this way I hope to brood at least 1,800 baby chicks this spring. Expect to have the first chicks by March 1, so ask you to speed these things along.

"J. G. B. Newhard,
"Mgr., Beecham's Laboratory."

Of course, if Mr. Newhard had not been well pleased with the first lot of Putnam Brooder Heaters he would not have ordered this second lot, nor would he have decided to entrust ALL his chicks to the Putnam Homemade Brooder for the first six weeks of their lives. SEASON OF 1921, with the hope of producing "at least 1,800 baby chicks." For large illustrated advertisement describing this Brooder Heater and telling of its superior qualities and my absolute guarantee, see page 288, herewith.—Adv.

I sold myself short on gladiolus bulbs. I might have sold a great many more flowers. I expect to raise more flowers and more poultry this year.

Last year I had three different breeds of hens and one of ducks. This year I have four of hens and two ducks; have also added geese.

I think it is better than having one kind. One customer will perhaps want Wyandotte chickens, another Barred Rocks, etc.

I find the same difference in selling chickens. One will want a chicken weighing 2 pounds or less. Another will want one that will weigh three or four pounds. For the first I have a Leghorn, for the other a Rhode Island Red, Wyandotte or Barred Rock.

I sold a little more than a hundred dollars worth of flowers, plants and bulbs.

I sold five hundred dollars worth of poultry products. My feed cost me about \$300. Of course there were other expenses, but at the end of the year I had 126 hens, pullets and cockerels, eight turkeys, eighteen ducks and two geese. My equipment is worth about seven times as much as last year. I attribute my success to satisfied customers who will come again and tell others.

New York. Mrs. Philip Murdock.

What Takes Place When an Egg Is Incubated.

Since many novices will be trying their hand at artificial incubation in the near future, permit me to explain in a few words what actually takes place in the egg during the period of incubation. I would crave permission to do this, for I am quite sure to make a successful incubator it is essential to have in the mind's eye what is actually taking place inside the egg.

After the hen has been sitting about 12 hours on an egg the lineaments of the head and body of the chick can be discerned in the embryo; at 36 hours the heart begins to beat, though no blood can be seen. In 48 hours two vesicles with blood can be distinguished, pulsation is evident; one of them is the left ventricle, the other the root of the great artery. Almost at once one of the auricles of the heart is noticeable, in which pulsation may be discerned as well as in the ventricle. About the seventieth hour the wings, and on the head two globules for the brain, on for the beak, and two others for the front and hind part of head may be distinguished. On the fourth day, two auricles approach nearer the heart. On the fifth day the liver may be discerned. At about five and a half days the lungs and stomach become visible, and on the sixth day intestines, veins, and upper jaw.

On the seventh day the brain assumes a more consistent form. On the eighth day the beak opens, flesh appears on the breast. On the ninth day the ribs are formed, full bladder is visible. The bile, green in color, is seen in a few more hours. On the tenth day feathers begin to shoot; at about the same time the skull becomes cartilaginous. On the eleventh day the eyes appear; twelfth day, ribs are perfected; fourteenth day, the spleen approaches the stomach, and lungs, the breast. On the eighteenth day the chick can be heard piping. From now onward it increases in size and strength until it emerges from the shell, when at this moment it will be found that the chick is heavier than the whole egg at first.—Poultry World, London.

No Room for Mongrels.

Poultry raisers throughout the country should not lose sight of the fact that it pays better to raise Standardbred poultry than the common barnyard or mongrel fowl. The Standardbred fowl costs no more to raise, house or market than the mongrel, they eat no more and lay better. They are more uniform in size and color, and when dressed for the market, they bring more per pound. Standard poultry can rough it as well or better than the common barnyard fowl. We, therefore, advise all who possibly can, to raise good strong, vigorous Standardbred fowls.

Hatching and Starting of Chicks.

(Continued from page 305)

Each morning after the incubator chicks are about five days old they should have a small quantity of cracker crumbs or a little steel cut oats scattered in the litter, just enough to make them scratch hard to get it.

A good way to provide exercise and at the same time supply green food is to throw a sod in their pen each day and let them pull it apart to get the tender blades and roots of grass. Before grass time sprouted oats make very good green food.

A mistake that many beginners make is in not getting their brooder chicks on to the ground soon enough. It seems impossible to get the most successful growth without giving them a run on the ground, regardless of how much green food they are given or how much moisture is used on the floors. Regardless of weather conditions get them out on the ground for a little while each day, at least by the time they are six to ten days old.

Do not use a board platform for the chicks to climb from the yard to the house. Some are liable to get under the platform and become chilled. Make a bank of earth, sand or coal ashes with the top level with the chick door and the sides gently sloping.

The first day give the chicks only a small run so they will quickly learn the way in and out, after which they may be given a more liberal run; but brooder chicks should never be given free range until well feathered out, as they must be where they can quickly enter the house in case of sudden storm.

Brooder reared chicks have one advantage over those raised with the mother hen; that is, they are less likely to become infested with lice.

I hatch and raise all my chicks with hens. When the chicks are taken from the nest I anoint each chick's head with olive oil. When they are about two weeks old I put a handful of lice powder in a bag, put in the brood of chicks and turn the bag over several times, dumping the chicks out on the back of the mother hen. Do this at night, and the chicks running under the hen will get the powder through her feathers also.

As warm weather comes on you will need to examine their sleeping quarters frequently for red mites. If any are found, spray the coops with 9 parts kerosene and 1 part of any coal tar dip or disinfectant, or use a good commercial lice paint.

To successfully raise chicks it is essential that their roosting quarters be kept clean, dry, cool, free from mites and well ventilated. Also that the chicks have sufficient room and are never permitted to sleep crowded at night. Failure to provide these conditions means weak, slow growing, stunted, unprofitable chicks. Crowded roosting quarters and filth cause purple barring and white in the plumage as well as poor size and shape. Feed liberally of good, nutritious feed.

Little chickens seem to be an especial attraction for rats. If you have only a single rat around your premises, bait him now, before the season of rat

WHY IS THIS HEN A MONEY-MAKER?

BECAUSE she was Bred right, Hatched right, Brooded right and Housed right. She was raised right—to produce EGGS. HIGH EGG YIELD IS A MATTER OF RIGHT METHODS. There is no accident, or chance, to it. You can have a high egg yield—and make money—if you Know How

KILL RATS

New Way by Science

HELP the U. S. Public Health Service in its great crusade to kill all the rats in the country. They cost \$150,000,000 a year, carry disease, spread plague. Rats rob average farmer of \$100 a year. What do they cost you? How much grain do they eat? How many baby chicks do they kill?

New Discovery Not a Poison

REEFER'S RAT VIRUS is its name. Bacteriological concentrate discovered by noted French scientist. Prepared in Government Inspected Laboratory. Does away with all traps and poisons. Entirely different. Used world over on ships, wharves, warehouses where rats are thickest. Sure death for every rat—absolutely harmless to everything else. Children can eat it as safely as jelly.

Guaranteed to Kill Every Rat on Your Place in SIX Days

Use REEFER'S RAT VIRUS and in 6 days every rat on your place will be gone—or your money back. What greater proof of its merit could you want? You don't have to suffer from rats any more. You can kill them SURE.

Rats Die Outside!

Always die outdoors seeking water. No rotting odor. No rats to kill. Only perfect rat killer invented. Approved by highest scientific authorities. Sure death—safe—simple to use.

6-Day FREE Trial

Prove that your rats can be killed in 6 days without risk. Take advantage of this great offer. Fill out coupon. Use REEFER'S RAT VIRUS for 6 days. If there's a single rat left, your trial costs you nothing. Isn't that fair? Don't wait! Rats are costing you money every day you delay. Spread disease, cause fires—don't hesitate—accept this square-deal offer.

Don't Delay

Don't tolerate rats any longer. Fill out coupon and mail. For just \$1.00 we will send you enough Reefer's Rat Virus to clear a big barn or house of rats. Send for it! Try it! 6 days later, if there is a rat alive, you get your money back. Every rat killed means \$10 saved. Every living rat costs you \$10 a year. Get rid of every rat—here's your chance.

Mail This Coupon

E. J. Reefer,

Dept. 603
Kansas City, Mo.

I accept your offer. Enclosed find \$1.00 for one package of Reefer's Rat Virus. You agree to refund my money if I'm not 100 percent satisfied.

Name

Address

breeding starts. After chicks have been partly feathered, and nearly broiler size, rats have been known to carry off entire broods.

Ever since ancient days man has battled constantly against rats. In recent years a virus has been successfully employed. This virus inoculates rats with a disease peculiar to rodents and they communicate the disease from one rat to another, and thus the entire colony of rodents are wiped out. This virus contains the living germs of a disease fatal to rats only. Our dog once ate some and it did no more harm than make him a little sick for a day or so. What the rats ate infected them all and cleaned the premises. A number of leading poultry breeders are fighting rats with virus.

To Breed Fine Mottling on Anconas.

(Continued from page 304)

To head the pen, let us select a fairly dark male of good substance of body, with well mottled breast; the smaller the white tips, the better. It is the male's breast that puts the color into your pullets. Mate him to about six females, three of them fairly dark, feathers wide and of good sheen, with some tipping in wings and tips of tail. This has produced for me exhibition pullets. Also give him three females of extra large size, mottled profusely, particularly down the neck and shoulders; but, above all, solid black in wing color, also with as heavy a cushion as possible. These will produce good cockerels. This gives you a single mating that will produce exhibition cockerels and pullets. At least, it has for me.

I am frank to say that last season a mating of mine, consisting of a fine exhibition male and my three best exhibition females, produced a large percentage of both exhibition cockerels and pullets, and this season we will again have a mating of the same kind. We expect good results from it, and thus hope to establish a line in the next couple of seasons that will produce exhibition males and females from a single pair.

To produce high quality specimens, year after year, requires the most careful thought and selection on the part of the individual breeder, as there is always that nightmare of getting good color and type but losing substance.

After it is said and done, all the systems in the poultry world are not worth two cents if the individual does not use his own head and, above all, put persistent effort with hard work behind it night and day.

Score Card Judging in England.

What is the danger of the moment? Score card judging! Once a fad, it has become a farce. At the Dairy Show one of the first prize winners was not a utility bird at all. That is in the sense that it had been pedigree-bred for utility purposes. It was "a waster" from an exhibition breeder's yard. Being too small for exhibition purposes it was put in the utility class on the off-chance that it would catch the judge's eye because of its smartness and prettiness. It did, and great was the laugh at the expense of the judge. At Westminster the score card business was also a farce, and the practical men made one huge joke of some of the judging.

If experts cannot pick out the layers in a flock of birds without handling each bird for about ten or fifteen minutes then no amount of handling or scoring will give them the knowledge. No two judges view the outward points in exactly the same way. How, then, can they agree on what they cannot see? If the visual test of comparison is misleading the attempt to estimate the inward properties by score card points will lead breeders into a veritable morass of confusion and a slough of distraction.—The Poultry World, London.

MILLIONS AND MILLIONS OF CHICKS —LET'S SAVE THEM!

DURING the spring of 1921, now right at hand, many millions of baby chicks will be sold and shipped from the numerous baby chick hatcheries and other millions will be hatched "at home" by the use of incubators, small and large. Reader, let's combine to keep down the death losses to as low a point as we can! Will you do your share? Then BE SURE to make provision for the cold nights and stormy days that are CERTAIN to come upon us, during March, April and the forepart of May—all through May, in northern latitudes. Proper provision during cold nights and stormy days means a steady, constant supply of moderate heat. That is exactly what you get by using the Putnam Brooder Heater (sent complete for \$4.75 postpaid to any address), installed in a Homemade Putnam Brooder. Kindly note recent sample letter:

"Middletown, Ohio, Nov. 4, 1920.

"Mr. I. Putnam, Elmira, N. Y.

"Do you have stoves for water fountains that heat like your Putnam Brooder Heater? If so, send me price list. I have two Homemade Brooders equipped with Putnam Brooder Heaters in which last spring I raised seventy-eight chicks, and I sure had fine success. I would never think of letting a hen raise them as it is less trouble with a Putnam Homemade Brooder, and you know where your chicks are at and they must have heat of some kind cold nights and wintry days. That is why I want to know if you have a water heater that works the same way that your Brooder Heater does.

"Mrs. Nelson Wootan."

For large illustrated advertisement describing this Brooder Heater and telling of its superior qualities and my absolute guarantee, see page 288 herewith.—Adv.

How to Raise Chicks

HEARD AT THE SHOWS.

We often wonder why such men as H. P. Schwab, Newton Cosh and others who are so opposed to a standard for Light and Dark Barred Rocks, ever judge these classes. Several breeders have said to me that if they were as much opposed to a standard for Light and Dark Barred Rocks as some of the judges claimed to be, they would refuse to judge them.

One of the big surprises we met this past season was the large increase in number of the grand old Silver Wyandottes we saw at the shows. There was a fine class at Detroit, Mich. At Lancaster, O., they were next to the largest class in the show; 117 birds in the class, shown by eleven exhibitors. The Ohio State Meet of the Silver Wyandotte Club was held in connection with this show which, perhaps, was responsible for this grand exhibit. Silver Wyandottes are good show birds and have the reputation of being a good market fowl and grand layers. The old saying is: "You can't keep a good breed down."

Ancona breeders are making wonderful improvements in the type and color of their variety. Judges and breeders are selecting birds that are much nearer to what the Standard calls for. A few years ago you would find breeders in one section of the country breeding birds almost black and in another section they would be almost white. Extremely high tails and bad combs are disappearing; perhaps the most progress is being made in these sections. A bird of good type and nicely mottled plumage is not easy to produce, but who values any thing that comes easy? The stronger the competition the more interest we find in a breed.

Did you notice the large increase in the number of entries in S. C. Brown Leghorns at the shows this past winter?—218 birds at the Chicago Coliseum is going some. The East and the West met there, which brought out real quality. I understand that \$500 was refused for one bird in this class. I believe that fanciers can afford to breed them at that price. Chicago is not the only place where they had a large class of Browns. The Ohio State Meet of the American S. C. Brown Leghorn Club brought out 132 birds, which is not bad for the fanciers of the Buckeye State.

R. I. Reds sure have a bunch of boosters behind them. There are two things I look for at every show and that is a bunch of Red boosters, and the famous cry from the subscription solicitors: "Are you interested in poultry?" Some people object to these subscription agents, but I think a show is dead without one or more of these fellows around, that is, if they sell a good poultry journal.

Looks as though there is going to be a real contest for the presidency of the A. P. A. this year. With such good men as Rigg, Wolseiffer and Palmer in the race, we look for a real contest. It has always appeared to me that there was not enough interest taken in the A. P. A. elections. Perhaps it was because there have been too few real contests for the important offices.

Get My Quick Money Saving Price

Hatches Now Mean Profits In June

Early hatches always early profits. If your hatches are not already started, I can help you to get them agoing in double quick time. I'll quote you a money-saving price on Old Trusty and get it to you with prompt delivery either by express or freight. Write and let me tell you about the money-saving proposition I can give you on Old Trusty.

Remember, you are not trying somebody's experiment when you put eggs in Old Trusty. Raising poultry has been a "dyed in the wool" proposition with the Johnsons for years and years, and Old Trusty grew out of our own experience. We build it to give real service and the fact that many of our first machines are still giving satisfactory service is good proof that Old Trusty means business for you all the time.

This shows Old Trusty as it reaches you — crated safe and sound — and built complete except to put on legs and lamp shelf, which are packed inside to save space in shipping.

\$1,000 Incomes Not Uncommon With Old Trusty

Mrs. Fred Johnson of Greely, Kansas, says: "From January 1, 1920, to January 1, 1921, I sold \$966.13 worth of poultry and eggs." Mr. R. F. McDonald of Manchester, Iowa, says: "My poultry profits for ten months are \$1,084." A bank clerk in Beatrice, Neb., cleared \$1,300 above expenses. Thousands of Old Trusty customers make money like this. They begin early. A fine thing about making hatches with Old Trusty is the fact that it makes big hatches just the same in cold winter months as it does in the late, warm spring. There are nearly a million Old Trustys in use now—some of them right in your neighborhood.

Shipment on Old Trusty

Our warehouse location in the railroad center of St. Joseph, Mo., enables us to make shipments that reach practically any part of the country in surprisingly short time. Don't worry about our getting your machine to you in time. We have a first-class traffic manager who takes the worry out of Old Trusty shipments and routes your machine so it will get to you as fast as the railroads can carry it. And remember, Old Trusty comes to you with the freight paid, and that's no small saving with the present high freight rates. This is just a part of our service in getting Old Trusty to you without delay.

Send the Coupon Today for My "How" Book of Poultry Profits

You'll need it right soon in solving this year's poultry troubles. It's a real poultry raisers' guide—a "how" and "why" book on the profits of poultry raising. Thousands of my customers send for my book every year because they know it's full of facts and that's what they want. It's filled with our 25 years' experience. It tells why early hatches pay; how to keep hens a-laying in winter; how to pick the money makers from a flock of pullets; how to make an inexpensive poultry house; how to choose the right-sized incubator and scores of other "hows" and "whys" and most of all, tells you what you want to know about Old Trusty and gives you my 1924 money-saving price. Just fill in and mail the attached coupon and a free copy of this helpful book will soon be in your hands. Or, if you choose, send me a postal or personal letter. Write me about your poultry plans and maybe I can give you some valuable suggestions. But send it early so you can have the book to help you right now and get your machine delivered to you. Yours truly,

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I have just purchased a farm in southern New Hampshire. It is level land, with a sandy loam soil. Please advise me which are the best fruit trees to plant on this soil, to be set out in poultry yards for shade. Baldwins, McIntosh, and Gravenstein are the best selling apples here. There is a good market for peaches, but none for plums. What varieties would do the best on this light land? Also, what would be the best tree to plant for a windbreak? How far apart should such trees be planted? Would South Carolina poplar be the best for shade in front of residence? New Hampshire. Ralph S. Paige.

The Baldwin, McIntosh Red, and Gravenstein are especially adapted to your conditions. I advise you to plant these varieties, also Wealthy. You will find peach growing very unsatisfactory. Plant only a few peach trees, such as Eureka, Early Elberta, Elberta, Crawford, and Rochester. The best evergreen for a windbreak is Norway spruce. Why plant such an undesirable tree as Carolina poplar in front of your house, when you can plant the very desirable Norway maple?

* * *

Every fruit grower who attends the national apple show and the various state meetings knows George W. Owens. To know George W. Owens is to love him. A congressman from South Dakota, a state senator in Michigan, and for years a very prominent physician, he is now active in the fruit growing development of the central west and the southwest. Out at the Council Bluffs show a number of us were sitting in the hotel one evening. A young man entered the room and was at once lost to view in the crowd. He was engaged in making a hard fight along a certain line in the spraying of apple trees. Each of us expressed the hope he would win out. And then George W. Owens gave us this:

If with pleasure you are viewing any work a man is doing,

If you like or love him, tell him now. Don't withhold your approbation till the parson makes oration,

And he lies with snowy lilies o'er his brow. For no matter how you shout it, he won't really care about it,

And he won't know how many teardrops you have shed.

If you think some praise is due him, now's the time to slip it to him, For he cannot read his tombstone when he's dead.

More than fame and more than money is the comment kind and sunny.

And the hearty, warm approval of a friend. For it gives to life a savor, and it makes you stronger, braver,

And it gives you heart and spirit to the end.

If he earns your praise, bestow it; if you like him, let him know it—

Let the words of true encouragement be said. Do not wait till life is over and he's underneath the clover,

For he cannot read his tombstone when he's dead.

* * *

Have just bought a half acre of ground in Redford, Mich. Have a few Concord grapevines about four years old, which I would like to move. Kindly state the best time of the year to remove them, and also the best way to go about it. I also have a small apple tree which I would like to move. Please state the best time to remove it.

Michigan.

F. S. Mills.

Prune the grapevines down to about six buds this winter. In the spring dig carefully. Prune all broken roots and transplant. Reset apple tree early next spring, cutting each branch about one-third.

* * *

Please advise me regarding the culture of ginseng and whether or not it would be advisable to try to grow it here. It grows wild around here. Also advise me as to where I could best procure the seeds or roots, and at what time it should be planted.

Mississippi.

Mrs. Berry D. Brown.

I receive many letters like this. My advice is, do not attempt to raise ginseng. Every few years some fellow with seed for sale puts in an advertising campaign and paints the fortune to be made in the growing of ginseng. There is nothing in it. If this plant grows wild in your vicinity you can make fairly good wages by gathering and marketing the roots. If you insist upon starting a ginseng garden, go to the woods and carefully note the soil conditions under which the plants are

BUY a "BETTER" Incubator and raise More and Stronger Chicks. Write for your copy of our new catalog, describing the "BETTER" line. It will convince you that the line is correctly named. The easiest incubator to operate—uses less oil, has safety lamp, oil fount that requires only one filling during hatch, only correct copper hot water heating system, side regulator, fine cabinet construction and other exclusive features.

The BETTER PRODUCTS CO., Inc.

COLUMBUS, WISCONSIN

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil

Kills Lice

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.
J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right.
OSCAR THOMPSON,
Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.
JOHN HOLTRAP,
Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective.
HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter.
FRED S. WILLIS,
Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers.
EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried.
MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.
J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed.
MRS. L. M. JOHNSON,
Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.
BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.
L. G. STAYNOS,
Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

AMERICAN SUPPLY CO. Dept. 54 QUINCY, ILLINOIS

Seed Right by Using a Planet Jr.

For an early crop, you cannot afford to risk irregular or imperfect seeding. Planet Jr. Seeders are the most reliable seeders made, sure to bring good crops and save you valuable time when you need it most. Look for the name "Planet Jr." on the machine you buy. Price \$3.00, Postpaid

PARTIAL LIST OF CONTENTS

American Poultry Industry: Origin of domestic fowls, magnitude of the industry, tables showing the numbers and kinds of fowls raised in different states, export trade, average prices on poultry and eggs in leading markets for past twenty years. **Analysis of Standard Breeds:** Description of each variety, not alone from the fancier's standpoint but according to utility qualifications, including sixty pen drawings of ideal types by a leading poultry artist. **Companions of the Hen:** Special chapters on ducks, geese, turkeys, guinea fowls, and pigeons, care and feeding, market value. **Incubation and Brooding:** Natural and artificial methods, how to choose equipment, incubator management, selection of hatching eggs, fertility, baby chick industry, sitting hens, testing eggs, how to build incubator cellars and brooder houses. **Poultry House Construction:** Designs for all kinds of buildings, laying houses, colony houses, brood coops, curtain-front and open-front houses, interior fixtures, nests, perches, watering systems, labor-saving devices. **Feeding:** Analysis of foodstuffs of every description, how to compound rations for poultry of all ages and for all purposes, formulas recommended by leading authorities, feed hoppers, mixers, carriers, methods of distribution, records, storage-bins, costs, forced feeding, fattening, sprouting oats. **Diseases:** Symptoms and causes of all common ailments, remedies, with special references to white diarrhea, worms, and vermin, how to make disinfectants and dusting powders. Five chapters are devoted to the treatment of diseases. This is a treatise in itself. **Breeding:** Management of stock for increased egg production, selecting males, trapnesting, hybrids, pelvibone tests, prepotency, capacities of hens, pedigree breeding, marking fowls. **Management:** Advertising, selling methods, marketing, caponizing, by-products of the poultry flock, including the preservation and uses of manure, feathers, and so on; shipping instructions, preparing birds for exhibitions, preserving eggs, killing and dressing poultry, practical study of the formation of eggs, embryology, measures that prevent mortality among chicks, broiler raising, importance of good business methods. **Equipment:** Working plans and instructions on how to make all kinds of poultry appliances, self-rising doors, ventilators, catching coops, broody hen boxes, trapnests, fattening pens, egg candlers, feed hoppers, erecting poultry netting, racks for sprouting oats, hatching egg cabinets, electric egg tester, outdoor incubator, colony brooders, feeding frames, etc. **Commercial Poultry Raising,** in fact, is an encyclopedia brought right down to date. A copy should be in the hands of everyone who wants to make a profit from hens.

growing, and then duplicate that condition as nearly as possible in your garden. Secure the plants from the wood, transplanting them when dormant.

* * *

At present I am a salesman for a jewelry house and I do not enjoy my work. Previous to this position I was an engineer on the Rock Island railway, out of Blue Island, Ill.

My love for the raising of poultry, fruit trees and berries is so great that I have decided to quit my present position and build a bungalow on an acre and a half which I own at Midlothian, Ill., eighteen miles from Chicago, and start out in this enterprise. I have a small capital and intend to work at something until my trees begin to bear and my poultry flock is large.

Wish you would advise me through American Poultry Journal how many trees to plant and how far apart. Also the hardest of apple trees for this location. The soil is black loam with a hard clay subsoil. Would you advise dynamiting for better rooting? The soil is inclined to be a little sour.

I wish to raise all kinds of fruits and berries for home purposes and also a few to sell. Minnesota. R. E. Williams.

You may be able to secure an income sufficient to maintain yourself and family and to enable you to put away some money for the future, by fruit raising and poultry keeping on an acre and a half of land, but I seriously doubt it. It is going to cost some money to bring this fruit farm into bearing and to build up a paying flock of poultry.

The Delicious, Senator, Wealthy, Duchess, and Henry Clay apple trees will give you good results. Yes, it will be best in this soil to use dynamite in making the holes in which to plant the apple trees. For a home proposition your land is very favorably located. You will want not only apples, but Florence crabapples; Moore's Early, Worden, Concord, Diamond, and Niagara grapes; Terry, Surprise, and Waneta plums; Cumberland and Royal Purple raspberries; Red Cross and Fay currants, and Oregon Champion gooseberries; also a big bed of Dunlop, Haveland, Gibson, and Sample strawberries. Set apple trees 30x30 feet.

* * *

By March 1, 1921, I hope to be located on a 15-acre farm in a place called Parnell, about seven miles from Vineland, N. J. Seeing you are so strongly in favor of a diversified farm, I would like your advice as to planning and planting this farm so that we could have continuous cropping of fruit, vegetables and flowers and be able to work them ourselves, as there is only my wife and I. There are three acres of strawberries on it at present, and a few pears and cherries. Do you think that three acres of strawberries would be too much, with other crops to attend to, without outside help? All crops are truck crops. Does the White Minorca lay as many and as large eggs as the Black Minorca variety? Herbert Mathas.

New Jersey.

I do not believe it is possible for you and your wife to take care of a 15-acre fruit farm without employing a man regularly and several people in the season of picking and marketing fruits and vegetables. It is not possible to do so. I think you will do best by making, say, eight acres of peaches, selecting the varieties which for a series of years have proved best for your section. You can secure this information from growers in your immediate locality, and it is the safest advice you can get anywhere.

Plant two acres of Yellow Transparent apples, making two-thirds of the orchard this variety and the remaining one-third Wilson Red June.

Divide the rest of the ground as your needs seem best, planting largely of Royal Purple raspberry, and strawberries. Yes, three acres of strawberries is too much for two people to handle

Let Us Fill the Idle Space in Your Garden with This Mammoth Fruit Collection

You can have Ripe Red Raspberries ninety days after planting! Big Melting Dewberries the next summer! And loads of Red, White and Blue Grapes, - and delicious Pears and Apples - in just a few years! Almost without cost to you! Read our liberal offer, and get this Mammoth Fruit Garden started NOW.

If you would enjoy having a Fruit Garden and Orchard like this, - Seventeen Trees, Vines and Berry Bushes, just plant this Mammoth Fruit Collection.

SELECTED FRUIT PLANTS

The Red Raspberry and the Dewberry plants in this collection have been selected from fields that have made high records for heavy production of quality fruit. By following the Instructions, you can secure new plants every year from these we send you, and extend your planting every season. The REX everbearing red raspberry will begin to bear in ninety days after planting, and continue until fall.

ONE SNOW APPLE

Deep red skin, almost black. Pure white flesh of peculiar rich flavor. Very sweet and juicy. Bears big crops at an early age. A Russian variety and very hardy.

ONE WEALTHY APPLE

Another favorite Russian variety. Yellow, overcast and streaked with red. Flesh is sweet, melting and tender, but slightly tart. Has few equals for every purpose.

Satisfactory Growth Guaranteed!

The Seventeen plants, grafts, etc. in this collection are GUARANTEED to reach you in good condition, and to grow to your satisfaction. Failing in which, they will be REPLACED, at your request, absolutely without charge.

3 NIAGARA GRAPE - White -

Immense clusters of delicious, waxy-white grapes. Remarkably sweet and juicy. Good for wine, preserves or jelly. In flavor it much resembles the Concord. A prolific bearer.

3 CONCORD GRAPE - Blue -

The best blue or purple grape grown, and the universal favorite. More Concord are grown and sold every year than all other varieties, on account of its wonderful quality.

Complete, Illustrated Instructions for Planting

are wrapped in each package. They are fully illustrated with pictures and diagrams, showing just what to do, and how and when to do it. By following these simple directions you will have success.

APPLE AND PEAR TREE GRAFTS

These apple and pear tree grafts are produced by a method that insures every good quality. From bearing trees, the new branches ("scions") are cut and carefully grafted to a root of the same type. The fruit tree graft, thus complete, takes root as soon as planted, makes rapid growth, and in just a few years bears heavy crops of choice fruit. Each apple or pear tree graft is about a foot in length.

2 REX Everbearing Red Raspberry

A picking every week from June to October. The new canes bear first year, 90 days after planting. Berries large, firm, sweet, and of delightful flavor. A most dependable new fruit.

2 Improved Lucretia Dewberry

Vines covered every summer with immense clusters of big, sweet berries. Rich, winey flavor. Very juicy. Individual fruits average 1 1/4 inch long and an inch through.

"CALLOUSED GRAPE CUTTINGS"

From selected vines in the best of the great Southern Michigan vineyards, cuttings about nine inches long are taken, and buried in damp, cool pits until they undergo a process called "callousing." The cuttings will then take root as soon as planted. The "Calloused Grape Cuttings" in this collection are all produced in this manner. They grow rapidly, make strong, healthy vines, and bear large crops.

ONE KIEFFER PEAR

Large, angular, and slightly irregular in shape, this old variety is the standard winter pear everywhere. Dark green. A splendid keeper, at its best in late winter.

ONE BARTLETT PEAR

Yellow skin with red blush. Flesh sweet, juicy and spicy flavor. Very melon when ripe. Can be picked and eaten from the tree. Yields heavily, begins to bear early.

properly in the picking and marketing season. Would not plant any more pear or cherry trees. The White Minorca lays as large an egg and as many of them as does the Black Minorca.

* * *

As I am going to plant an orchard this spring, I would like some advice. I was thinking of planting Stark Delicious, Golden Delicious and Stayman Winesap for winter applies; Liveland Raspberry and Wilson Red June for summer; Wealthy for fall, and Florence crabapple. Would you plant Silas Wilson and Eastman in place of the above? In plums, I am thinking of planting Omaha, Mammoth Gold, Gold, and Early Schiro.

Would the Lincoln and Seckel pears be all right? Will the Eureka peach do well here? In grapes, what would you recommend? Are Montmorency, Suda Hardy and Stark's Gold cherries hardy enough for my planting?

I had a letter from Ames saying not to plant Delicious, Jonathan and Grimes Golden here—that they were not hardy.

Iowa. O. A. Volberding.

Do not plant Stayman Winesap in north central Iowa. It is not hardy enough. Would not plant Silas Wilson and Eastman in preference to the varieties you have selected.

Of the plums you name, only Omaha is hardy enough for your planting; the others will go out the first winter, or in a few seasons, at best. Plant Omaha, Surprise, Wyant, Terry, and Desoto.

Think you will find pear growing a failure. Yes, try a few Lincoln and Seckel.

Do not waste time in planting peach trees. Advise you to plant Worden, Concord, and Niagara grapes.

Montmorency and Suda Hardy cherries are hardy in your section. Stark Gold has not yet been sufficiently tested.

Delicious is certainly hardy enough for planting far north of your place. They are fruiting far into Minnesota. Jonathan and Grimes Golden are not hardy enough for your planting.

* * *

Will you please tell me how blueberry vines are propagated?

Are blueberry seeds sold like vegetable seed and if so, where could one buy them?

Maine.

A. S. Carter.

The blueberry vine is propagated from cuttings and from the roots. The seed is not offered for sale by seed dealers generally. You can arrange for seed in any district where the plant is largely grown.

* * *

I am 18 years of age and finish high school this year. I have always had the idea of some day raising poultry, bees and garden truck. Next summer I intend working for a seed house, then next fall I am going to enter Pennsylvania State College and take the two year course in agriculture, specializing in horticulture. I propose then to work for a seed firm for several years and after that buy a small place and go into business for myself. Am I on the right track, and what advice would you give me?

Pennsylvania. Chas. E. Landis.

You are certainly "on the right track." You do not, it would seem, need any advice from me. You have outlined a very wise and practical course.

* * *

I have purchased ten acres of land near Seattle and expect to engage in poultry raising and berry and small fruit culture. The land is a red shot clay quite well mixed with fine gravel. It has been logged off and then burned over. The rainfall is around 32 inches a year, mostly during the winter season. The tract will be irrigated from a mountain stream during the driest parts of the season. In your opinion would it be necessary to fertilize before setting out strawberries and other berries such as loganberries, blackberries, etc.? Would the rainfall have a tendency to leach out the soil elements? Would it be necessary to grow some other crop before setting out the berries this coming season?

The Rippley Triangle Double Cup Non-Freeze Poultry Fountain keeps water at drinking temperature summer or winter. Made of galvanized iron on principle of thermos bottle—two tanks with lined and sealed air space between them. No mechanical parts to get out of order. No lamp. Guaranteed. 2-gal., \$6; 4-gal., \$7; Round Style, Single Cup, quart, \$1.50; 1-gal., \$2.50. 2-gal., \$3.50; 4-gal., \$4.50; 5-gal., \$6.50.

When I read of the people asking you questions concerning localities so far inferior to soil quality, climate and marketing facilities to that offered by western Washington I feel sorry that there is no way to inform them of this great section which is so adaptable to berry and poultry raising. I have no land to sell but would like to help these people who are trying to establish themselves on a bit of land.

L. E. Wenbane.

Washington.

Without an analysis of your soil at hand I cannot fully advise you. It can be stated as being true, however, that your soil is lacking in nitrogen and humus. I advise you to sow it to some clover or other legume. Then turn this under. Have the soil analyzed by your state chemist. Timber land should always be worked either this way or put into a crop that requires intense cultivation before being planted to fruit trees or bushes. Unless you keep the ground well supplied with humus the irrigation will cause a leaching of the elements necessary to give the land fruit production.

* * *

I have five acres of land near lake shore in Hennepin County, Minnesota, ten miles from Minneapolis market. The soil is sandy and quite a lot of gravel, lays quite high and no trees or wind break. I want to set enough small fruit to make it pay—some apples, plums and cherries. Please give me your advice. I have a few trees of Duchess-Wealthy, Greenings and Wolf plums, also Florence crabs; have one thousand Senator Dunlap ordered for spring. I will raise White Leghorns for eggs. Will have fruit, poultry and bees. I have two cows, so will have lots of milk for poultry and will keep a couple of pigs. Have been raising pigs for three summers, but that's too big a job for one woman. Do you think I can make that combination pay?

Please tell me what you can about the Red Wing, Goodhue and Bayfield apples.

Minnesota. Mrs. F. K. Takahashin.

Situated as you are, you ought to make a combination of poultry and fruit raising, for your soil is not the best for apples, but you can, if you will fertilize the soil and keep it well supplied with humus produce apples profitably. The varieties you name are well suited to your conditions. Would make future planting of apples to Wealthy and Patton's Greenings. Plant Terry, Surprise and DeSota plums. The Dunlap strawberry is best for your purpose.

* * *

I have a few cherry trees here and also some currants and gooseberry bushes. Last summer they did not do well and I think they should be sprayed, but I am a beginner and would like some advice if you would be kind enough to give same, or advise me where I could find same, and also if Progressive strawberries are all right?

Colorado.

C. Christenson.

You do not state the nature of your soil. In all probability your trees and bushes suffered because you did not spray them. Cherry trees should be sprayed with scalecide when dormant in fall and spring. Then when bloom is dropping they should be sprayed with arsenate of lead and black leaf 40. Repeat this last spray every two weeks until fruit is beginning to ripen. The gooseberry (and currant bushes) should be sprayed with arsenate of lead as soon as all leaves are formed. This insures them against ravage by the currant worm.

* * *

I have a small place of four acres which gradually slopes to the south and is cut off from the north by an old orchard. I have about one and one-half acres in Elberta peaches, also a few Golden and Red Delicious and Winesap apples. My apple trees are not old enough to bear. My peach trees are, but have twice already lost a crop of

14-Year Old Girl Cleared \$1592⁶⁵

With Her Poultry in 9 Months

This remarkable record made by a girl only 14 years old who followed my tested and proved methods. What she has done, you, too, can do. Simply follow the secrets I have learned in more than 30 years experience in poultry farming. Read her letter—then send Today for my free book. It will show you how to make more profit in 1921 than ever before.

Your future success—your poultry profits next fall and winter depend upon your success in brooding, feeding and growing chicks now.

Bristol, Vt.

peaches by spring frosts when all other orchards in the vicinity suffered little and had big crops. Would apples do better on my land or would they also suffer through spring frosts? Could I keep my peach trees back by scattering strawy manure around the trees in the late winter before the frost is out of the ground? It has been my intentions to buy the adjoining ten acres and put it all in fruit, but since I have had a failure twice in peaches, was afraid to risk buying more. Could you offer me advice?

Illinois.

D. L. Wiegmann.

It is evident that your land does not have proper air drainage, inasmuch as other orchards near you have not suffered by late frosts, while you have lost two consecutive crops. I advise you to plant no more peach trees. No, there is nothing in the theory that any tree can be held back in the spring by heavy mulching. I advise you to confine your future planting to apple trees. I would put apple trees in this peach orchard with a view of cutting out all the peach trees in about two years.

* * *

I am trying to find out what is the matter with my blackberries. My soil is well filled with humus; I get good growth of cane; soil holds moisture well. Canes set just as full as they can get, but they do not get any size; do not dry up, but just get about half what they should be. This patch has been set five years; have had two crops. I planted these for Eldorado. I think they are true for I have dealt before with this man. One of our school teachers told me that it was blight, but did not know what to do for it. Have you had any experience with it?

Michigan.

Fred Bremmer.

It may be that your blackberries lack proper polonization. I advise you to plant some Ward blackberries among them. Spray them when dormant with scalecide, and when in full leaf spray with sulfocide, and repeat about three times at intervals of ten days. Sulfocide will keep the blight down, when thus followed by scalecide.

* * *

In improving and planting a 10-acre tract in southwest Missouri, we plan to set out one acre in orchard, one-half acre to small fruits and an acre to garden truck; the rest, aside from one acre to home grounds, to alfalfa, blue grass, clover, orchard grass, some grain and a wood lot. We plan to keep 50 to 100 S. C. White Leghorn hens, two Guernsey milk cows and a Duroc pig.

In selecting the varieties of the different fruits for orchard and fruit garden I became bewildered as to just which and how many we should have, to have an abundance for our own use and some to sell. I have made out a list, but it seems that there are too many varieties for a small orchard. Will you please name the kinds and the number of each that will in your opinion be the best? We want the best in as few varieties as possible.

Missouri.

Mrs. Gladys Cross.

You have by far too many varieties in the list submitted. I am going to consider the number of apple trees you name—25. I would plant seven Wealthy, two Henry Clay, five Delicious, six Golden Delicious, five Grimes Golden. Peaches: 12 trees—Two Red Bird, two Mayflower, four Early Elberta, two Hale, two Krummel.

Plums: Six trees—Two Omaha, two Terry, two America.

Pears: Two trees—Sickel and Lincoln.

Cherries: Six trees—Montmorency.

Grapes: Make the collection of Moore's Early, Delaware, Niagara, Worden and Concord, planting one-third Worden, one-third Concord, with remainder about evenly divided as to varieties.

Strawberries: 125 Dunlap, 125 Havenland, 125 Gibson, 125 Sample.

103-DEGREE INCUBATOR

THE 103-DEGREE INCUBATOR

Hatches everywhere, strong, healthy chicks that will live, because of many new patented improvements.

The Most Wonderful Incubator Invention Ever Thought Of
The Tilting Chimney—biggest incubator improvement in years—controls the heat before it enters the boiler, not afterwards. Impossible to overheat or underheat the eggs—guaranteed 103 degrees all the time. No need for an incubator cellar, any room will do. No fuss or worry, no getting up in the night, only one regulation. Guaranteed fully automatic.

Patented Two-Circuit Hot Water Heating System

The first really effective hot water heating system. Every cubic inch of the egg cabinet always at the same even temperature. Forces the water to keep busy every minute, no hot spots or cold spots.

Perfect Ventilation Guaranteed

The combination of the Tilting Chimney and Two-Circuit Hot Water Heating System makes it possible to thoroughly ventilate every part of the egg cabinet at all times. 103-Degree Incubators are guaranteed entirely free from odor.

Four sizes. There is a 103-Degree for every poultry raiser. 103-Degree Incubators get results anywhere. Guaranteed to adjust temperature variations of 66 degrees between high and low.

One Hatch Free

enables you to prove what others merely claim. All 103-Degree Incubators carry the most liberal guarantee ever made.

A Guarantee Written for Your Protection

New Idea Hatching Chart mailed to you for the asking. Measures the efficiency of any incubator. For full descriptive matter and sales plan write

Note the Large Glass Top:

CLOSE-TO-NATURE
An Incubator Without a Fad or Frill
Solid, Substantial, Dependable

The old, well-known name, "Close-to-Nature" is a guarantee of a safe, sound sensible incubator.

INCUBATORS AND BROODERS

Not made impracticable by a multitude of "special features" which only add expense without efficiency. Easily operated, and responds so quickly to the thermostat that there is no over-heating of eggs; for you know an over-heated egg means a weak, crippled, or a dead chick. Warm water heat, double walled construction, and large glass top that enables a view of the entire egg chamber without opening the doors. Made in five sizes from 60 to 300 eggs. Write for full information.

OPEN AIR HOVERS AND BROODERS
Apply the three "Close-to-Nature" principles: Contact warmth like the hen; fresh air ventilation, not hot air; no piling up or overcrowding. Nothing now advertised like these brooders and hovers—highly successful, and as natural as Nature itself.

CLOSE-TO-NATURE COMPANY
38 Front St. Colfax, Iowa

Write for circulars.

**SUCH CONDITIONS NOT INVITED,
BUT PUTNAM HOMEMADE BROODER
MET THEM.**

TO READERS of this journal who are planning to brood little chicks this spring by artificial means—whether hatched at home or bought in the form of baby chicks, we ask: What would YOU think of a low-cost homemade brooder that would care for twenty-one chicks buried in three and one-half feet of snow for thirty-six hours in a Rocky Mountain blizzard and that brought the chicks through all right? A Putnam Brooder Heater (price \$4.75 prepaid to any point east of the Rocky Mountains), was "on the job" and did this. Here is the evidence, word for word:

"Denver, Colo., Oct. 26, 1920.

"Mr. I. Putnam, Elmira, N. Y.:

"Enclosed please find P. O. order for \$6.00, for which send me three of the Little Putnam Stoves and directions for building the Homemade Oat Sprouter and your non-freeze water fountain.

"I have one of your Putnam Brooder Heaters that I got last spring and it is the best heater I ever saw. Last spring I had twenty-one chicks of fair size in a brooder box out doors with a 4x6 wire run. Box was made per your directions and equipped with the Putnam Brooder Heater.

"We had a thirty-six hour snow storm—and high wind—drifting all the time.—We covered the brooder box and run-way with canvass and left the heater burning. The next morning it was entirely covered with snow, three and one-half feet deep. When I dug in, the chicks were all right and the Brooder Heater was working right along.

"Had been afraid it would go out in the night, but you can't stop it! The Putnam Heater, like the Little Putnam Stove, is always on the job. Please send me the three stoves as soon as possible.

A. H. Behr."

For large illustrated advertisement describing this Brooder Heater and telling of its superior qualities and my absolute guarantee, see page 288, herewith.—Adv.

64 BREEDS Most Profitable chickens, ducks, turkeys and geese. Choice, pure-bred, hardy, northern raised. Fowls, eggs and incubators at low prices. America's great poultry farm. 28 years in business. Send 5c for large valuable poultry book and catalog. A guide to success.

R.F. NEUBERT Co., Box 910, Mankato, Minn.

Gooseberries: All Oregon Champion.

Raspberries: Cuthbert, Cumberland and Royal Purple.

Blackberries: Mersereau and Eldorado.

Currants: Red Crown and Diploma.

You will find these varieties will be best suited to your soil and climatic conditions, and will give you a long season of fruiting.

* * *

I would like your opinion on the best variety of plums for my locality—South Central Wisconsin; also cherries? It gets quite cold here, sometimes as low as 40 below, though not often. Would the Hansen plums be hardy here? Where can they be procured? I only wish to plant a few—enough for home use. Will you please suggest some books on horticulture; some good for a beginner who knows nothing of the fruit business, but who wants to learn.

Wisconsin.

A. L. Propp.

You cannot successfully grow cherries where the thermometer gets down to 40 below. However, I would plant a few Montmorency cherries and have the fun of watching them—and you might get some cherries. Yes, the Hansen plums would do well with you. I advise you to plant them. Also the DeSota plum. You can get them of the South Dakota or Minnesota nurserymen. The Gurney Nursery of Yankton, S. D. are introducers of them.

* * *
